ABSTRACT

The City of Annapolis contracted with AECOM to develop final engineering design plans and provide permitting support for the mitigation of flooding at City Dock through construction of a new pump station, realignment of existing storm drain systems, and grading along the existing bulkhead. The proposed undertaking will require ground-disturbing activities that could potentially impact subsurface archaeological resources. AECOM conducted a Phase II archaeological investigation within the proposed location of the control building and wet-well (henceforth Phase II Study Area) to determine if deposits associated with previously recorded 18AP39 are present within the LOD. The goals of the study were to evaluate the site's eligibility for listing in the NRHP and to identify significant archaeological deposits associated with site 18AP39 within the LOD, if present.

As a result of the investigation, AECOM recovered 3,297 artifacts and identified intact archaeological features and cultural deposits ranging from the late eighteenth through the early twentieth centuries. Diagnostic artifacts dated from the early eighteenth to mid twentieth centuries were identified, in many instances, from secured contexts. Specifically, the excavation of six 1-x-1 m TUs resulted in the identification of a late eighteenth century foundation, a plank floor and post hole possibly constructed as early as the 1830s, but no later than the late nineteenth century, and a brick foundation related to a building constructed no later than 1878. The nineteenth century features can be linked to at least two artisan/merchant class families living and working at these locations between 1840 and the 1890s. The eighteenth-century deposits may be associated with an early commercial enterprise which existed in this vicinity.

1.0 INTRODUCTION

The City of Annapolis (City) contracted with AECOM to develop final engineering design plans and provide permitting support for the mitigation of flooding at City Dock through construction of a new pump station, realignment of existing storm drain systems, and grading along the existing bulkhead (Figure 1-1). The proposed undertaking will require ground-disturbing activities that could potentially impact subsurface archaeological resources. In 2018, AECOM conducted a Phase IA archaeological assessment for the project's proposed Limits of Disturbance (LOD) to document historic land modifications to the proposed LOD, assess the potential of the proposed LOD to contain significant archaeological resources, and identify areas for additional archaeological investigations (Furgerson et al. 2018). Based on the results of the Phase IA study and consultation with the Maryland Historical Trust (MHT), AECOM conducted a geophysical survey of the proposed location of the control building and wet well and a review of geotechnical soil borings to better characterize the potential for this area to contain significant archaeological resources (Seibel et al. 2019). The results of the geophysical survey indicated high potential for archaeological features to be present in locations that will be directly impacted by the proposed undertaking.

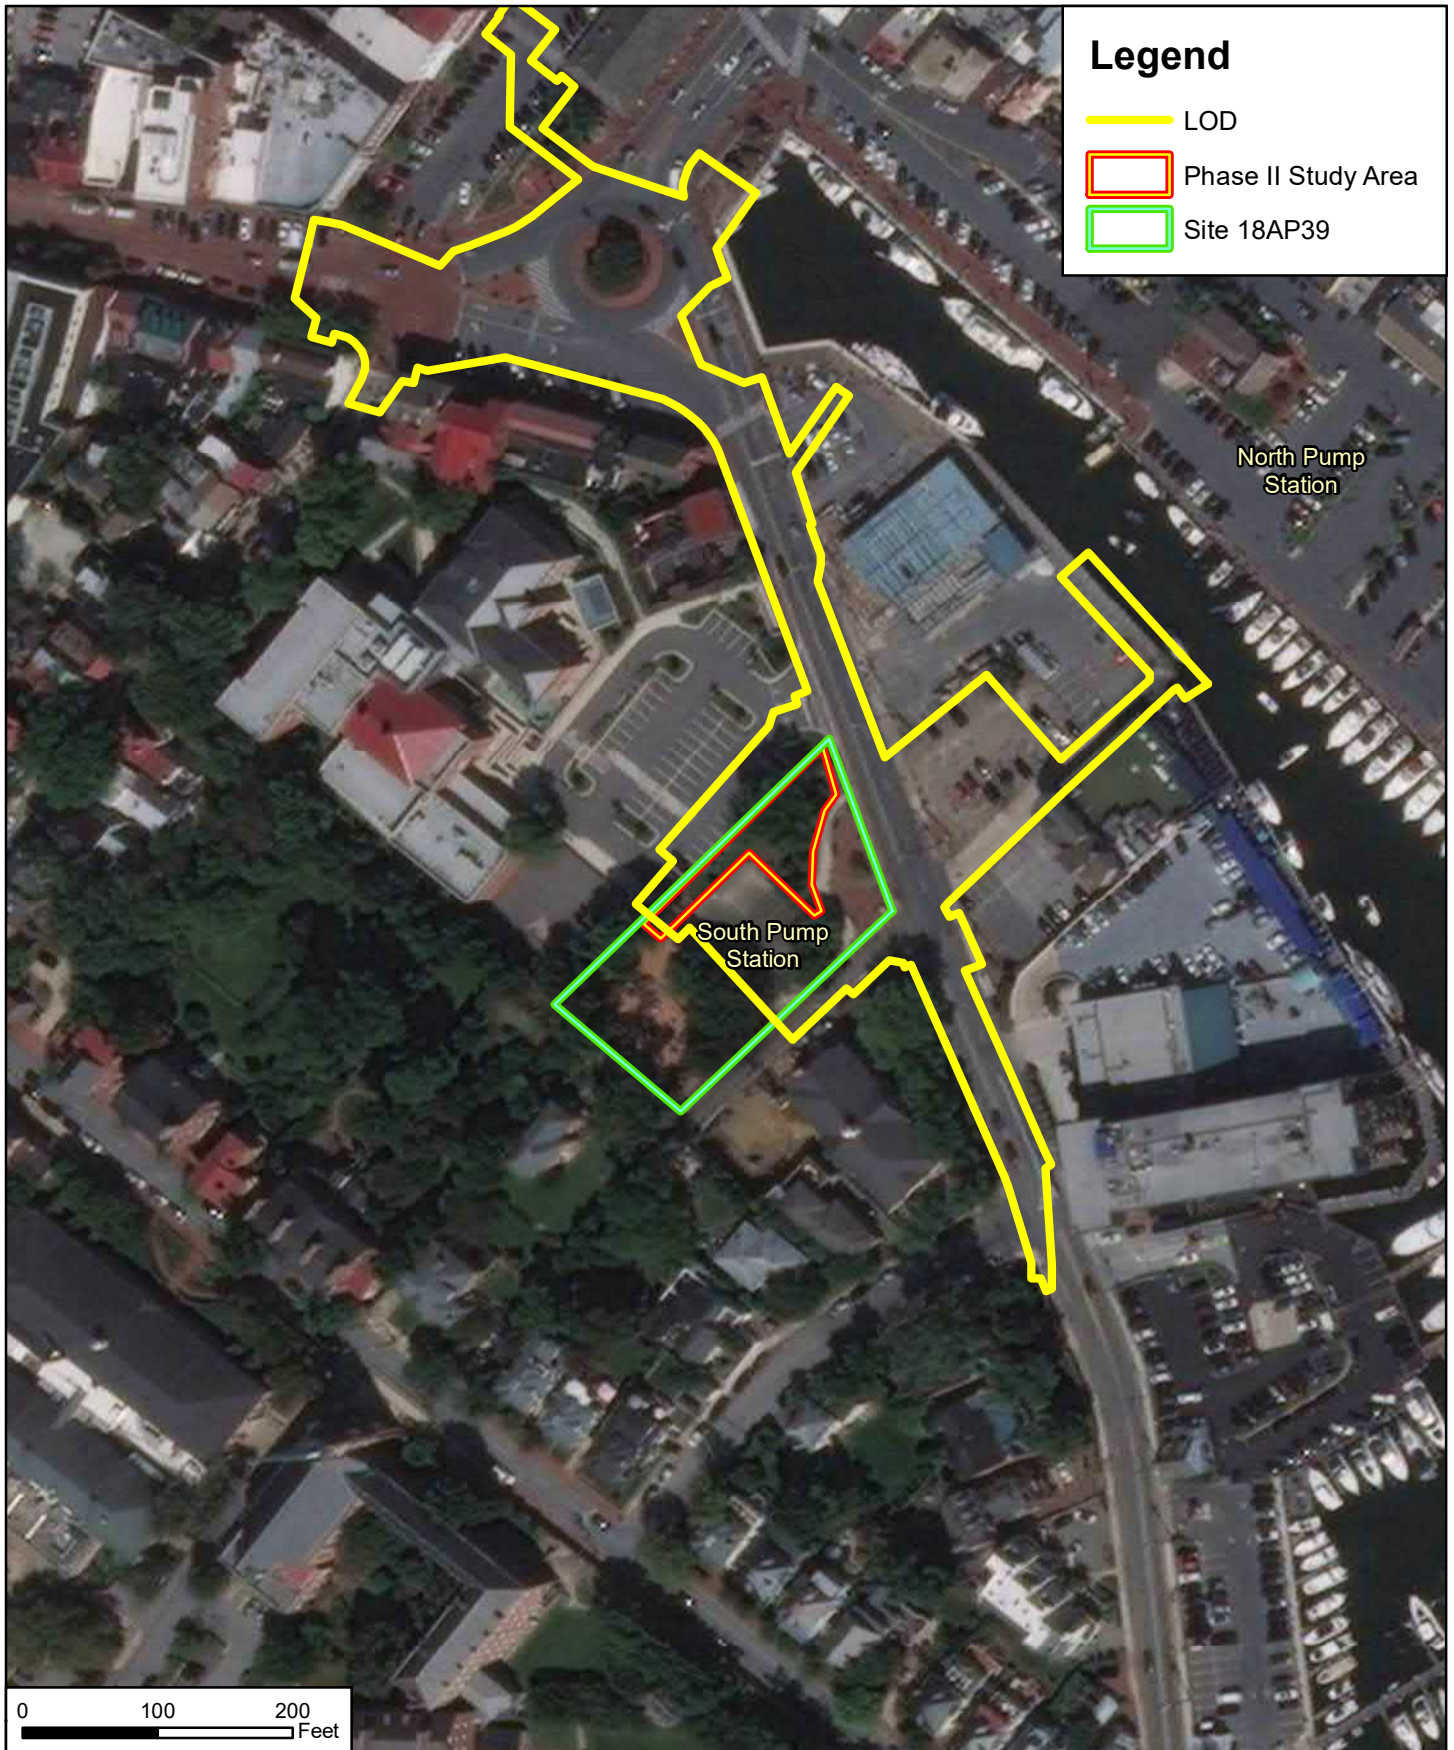

A Phase II archaeological investigation was conducted within the proposed location of the control building and wet well to determine if deposits associated with previously recorded 18AP39 extend into the LOD. The goal was to evaluate the site's eligibility for listing in the National Register of Historic Places (NRHP) and determine the location of significant archaeological deposits associated with the site within the LOD, if present (Figure 1-2). The general project area, including the proposed LOD and its immediate vicinity, is located in the Coastal Plain province within Maryland Archaeological Research Unit 7, the Gunpowder-Middle-Back-Patapsco-Magothy-Severn-South-Rhode-West Drainages (Figure 1-3).

The archaeological investigations took place in October 2019. Scott Seibel served as the Principal Investigator, Ralph Koziarski was the Field Director and was assisted by Kayla Marciniszyn, Barbara Guzman-Helton, Joseph Normandy, Benjamin Stewart, and Heather Crowl. Peter Regan served as senior historian. Kayla Marciniszyn was lab director and was assisted by Barbara Guzman-Helton and Benjamin Stewart. Following this Introduction, the report contains seven sections of text: Project Location and Description; Cultural Context; Previous Investigations; Research Design; Results and Interpretations; Summary and Recommendations; and References Cited. Appendix A contains the Qualifications of the Investigators, Appendix B contains the Artifact Catalog, and Appendix C contains the Site Form.

2.0 PROJECT LOCATION AND DESCRIPTION

2.1 GEOLOGY, TOPOGRAPHY, AND HYDROLOGY

The project area is located within the Atlantic Coastal Plain physiographic province, which consists of low-relief terrain characterized by terraced landscapes rising west from the Atlantic Ocean to a maximum elevation of around 250 feet (ft; 75 meters [m]) above mean sea level near the Piedmont.

The Coastal Plain consists of unconsolidated sediments including sand, sandstone, silt, clay, and gravels that gradually thicken from the eastern Piedmont to the Atlantic Ocean. These sediments overlay eastern Piedmont bedrock along an irregular zone of contact called the Fall Line (Maryland Geological Survey 2018). Coastal Plain deposits date to the Triassic (250 million years ago) through Quaternary Periods (present).

City Dock is situated along Spa Creek, which drains into the Severn River. The Severn River is a 14-mile (mi; 22.4-kilometer [km]) long estuary that drains into Chesapeake Bay at Annapolis (Maryland Department of Natural Resources 2018). Elevations within the project area range between 2 and 10 feet (0.6 and 3 m) above sea level.

2.2 PROJECT AREA SOILS

Soils within the geophysical survey area are mapped as Urban Land and Collington-Wist-Urban Land (CpB) complex by the United States Department of Agriculture's Natural Resources Conservation Service (USDA NRCS 2018). The CpB complex is limited to the extreme western portions of the project area. Typical profiles for Collington and Wist soils are summarized in Table 1. Urban land consists of disturbed deposits with a high degree of taxonomic variability and may include materials redeposited from local or nonlocal sources. Because urban soil structure and formation cannot be predicted, it is not possible to define the structure of a typical soil column, though it is expected that non-native urban soils will present as mottled, compacted horizons possibly containing historic debris, cobbles, and gravel superposed above natural strata.

Table 2-1. Typical Soil Profiles

Soil Unit	Soil Horizon	Depth (inches)	Texture
Collington	Ap	0-10	Fine sandy loam
	Bt	10-34	Sandy clay loam
	BC	34-72	Fine sandy loam
Wist	Ap	0-13	Fine sandy loam
	BE	13-17	Fine sandy loam
	Bt	17-41	Sandy clay loam
	BC	41-82	Fine sandy loam

2.3 CURRENT CONDITIONS AND LAND USE

The current project area is within the Newman Street Playground and includes portions of the mulch-covered playground, the basketball court, vegetated areas, a brick covered plaza, and concrete sidewalks.

3.0 CULTURAL CONTEXT

The regional cultural context for this project can be found in the Phase IA assessment documentation (Furgerson et al. 2018). This chapter focuses on the history of the properties located within the project's LOD.

3.1 ANNAPOLIS PHASE II PROJECT AREA HISTORY

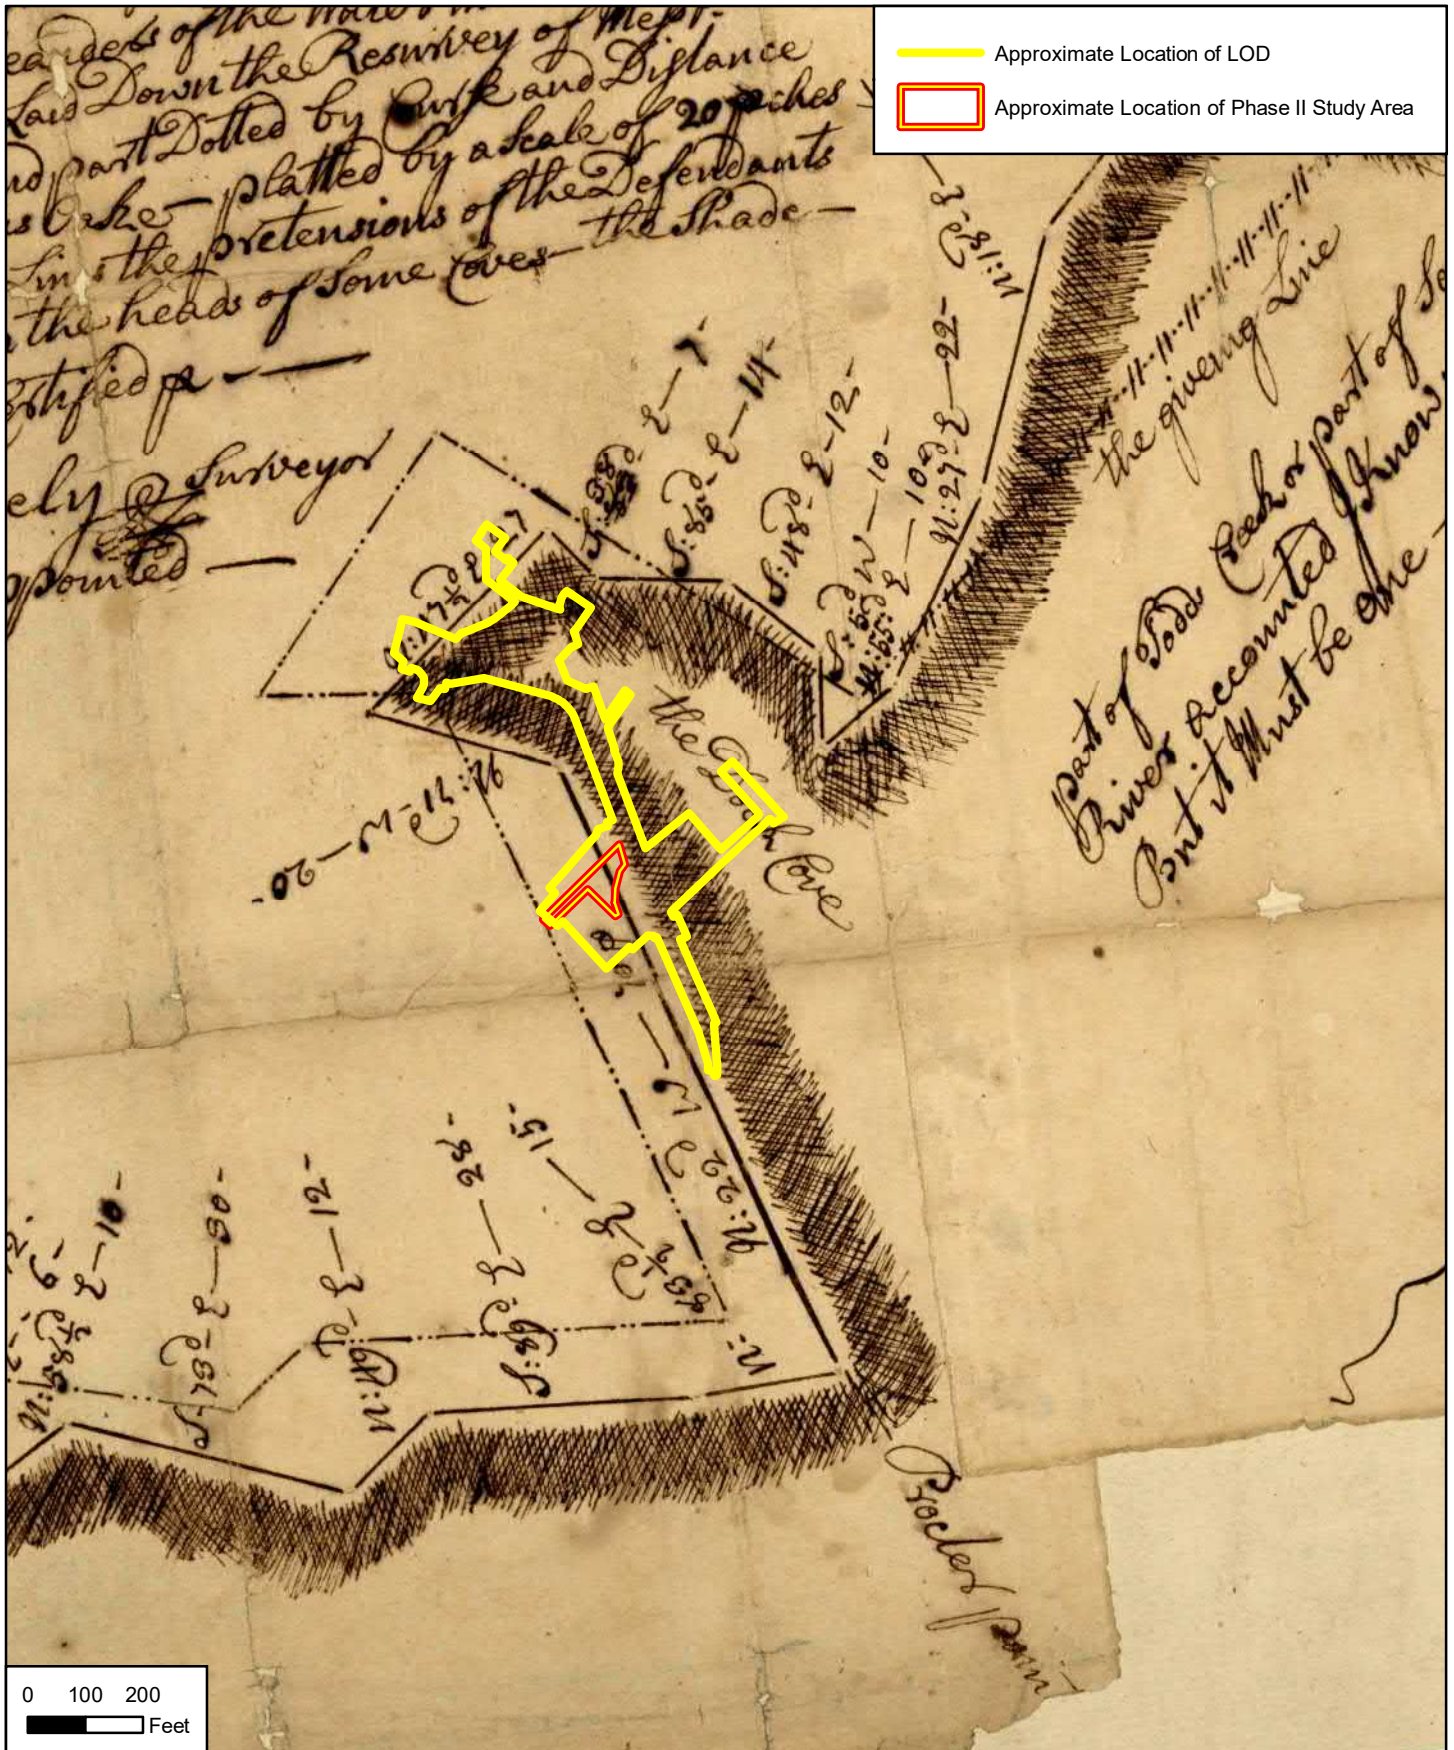

The following discussion charts the ownership history and development of the LOD to provide a localized contextual framework for the current study's archaeological analysis. Historic maps, photographs, and a variety of archival materials (e.g., land records, census data, periodicals) were consulted to create as complete a project area history as possible. However, it should be noted that some gaps in the chain-of-title preclude a complete representation of the subject property's ownership. Where these occur, they tend to represent small portions of the property and/or limited time periods and are expected to have minimal impact on interpreting archaeological materials.

Historic maps were digitally georeferenced to modern features, whenever possible. However; because these older maps were often hand drawn, or utilized less accurate survey methods, it is not always possible to precisely correlate them to extant landmarks and features. As a result, buildings and property boundaries may appear to slightly "drift" over time on the maps. When the effect was especially dramatic, the maps were stretched to fit as best as possible. Nevertheless, the locations of specific features on these maps must be considered somewhat approximate relative to current conditions.

The earliest available map to depict the LOD is the 1690 Ridgeley map based in part on a 1651 plat of Todd's Harbor (Figure 3-1). The area that would eventually become Annapolis' City Dock is shown as "Dock Cove." The LOD would have been located largely in the cove's tidal flats or open water, though some portions may have extended onto dry land. As with many early historic maps, the 1690 map incorporates spatial inaccuracies that cannot be precisely rectified with modern geospatial data, meaning the LOD as shown in Figure 3-1 is only an approximation.

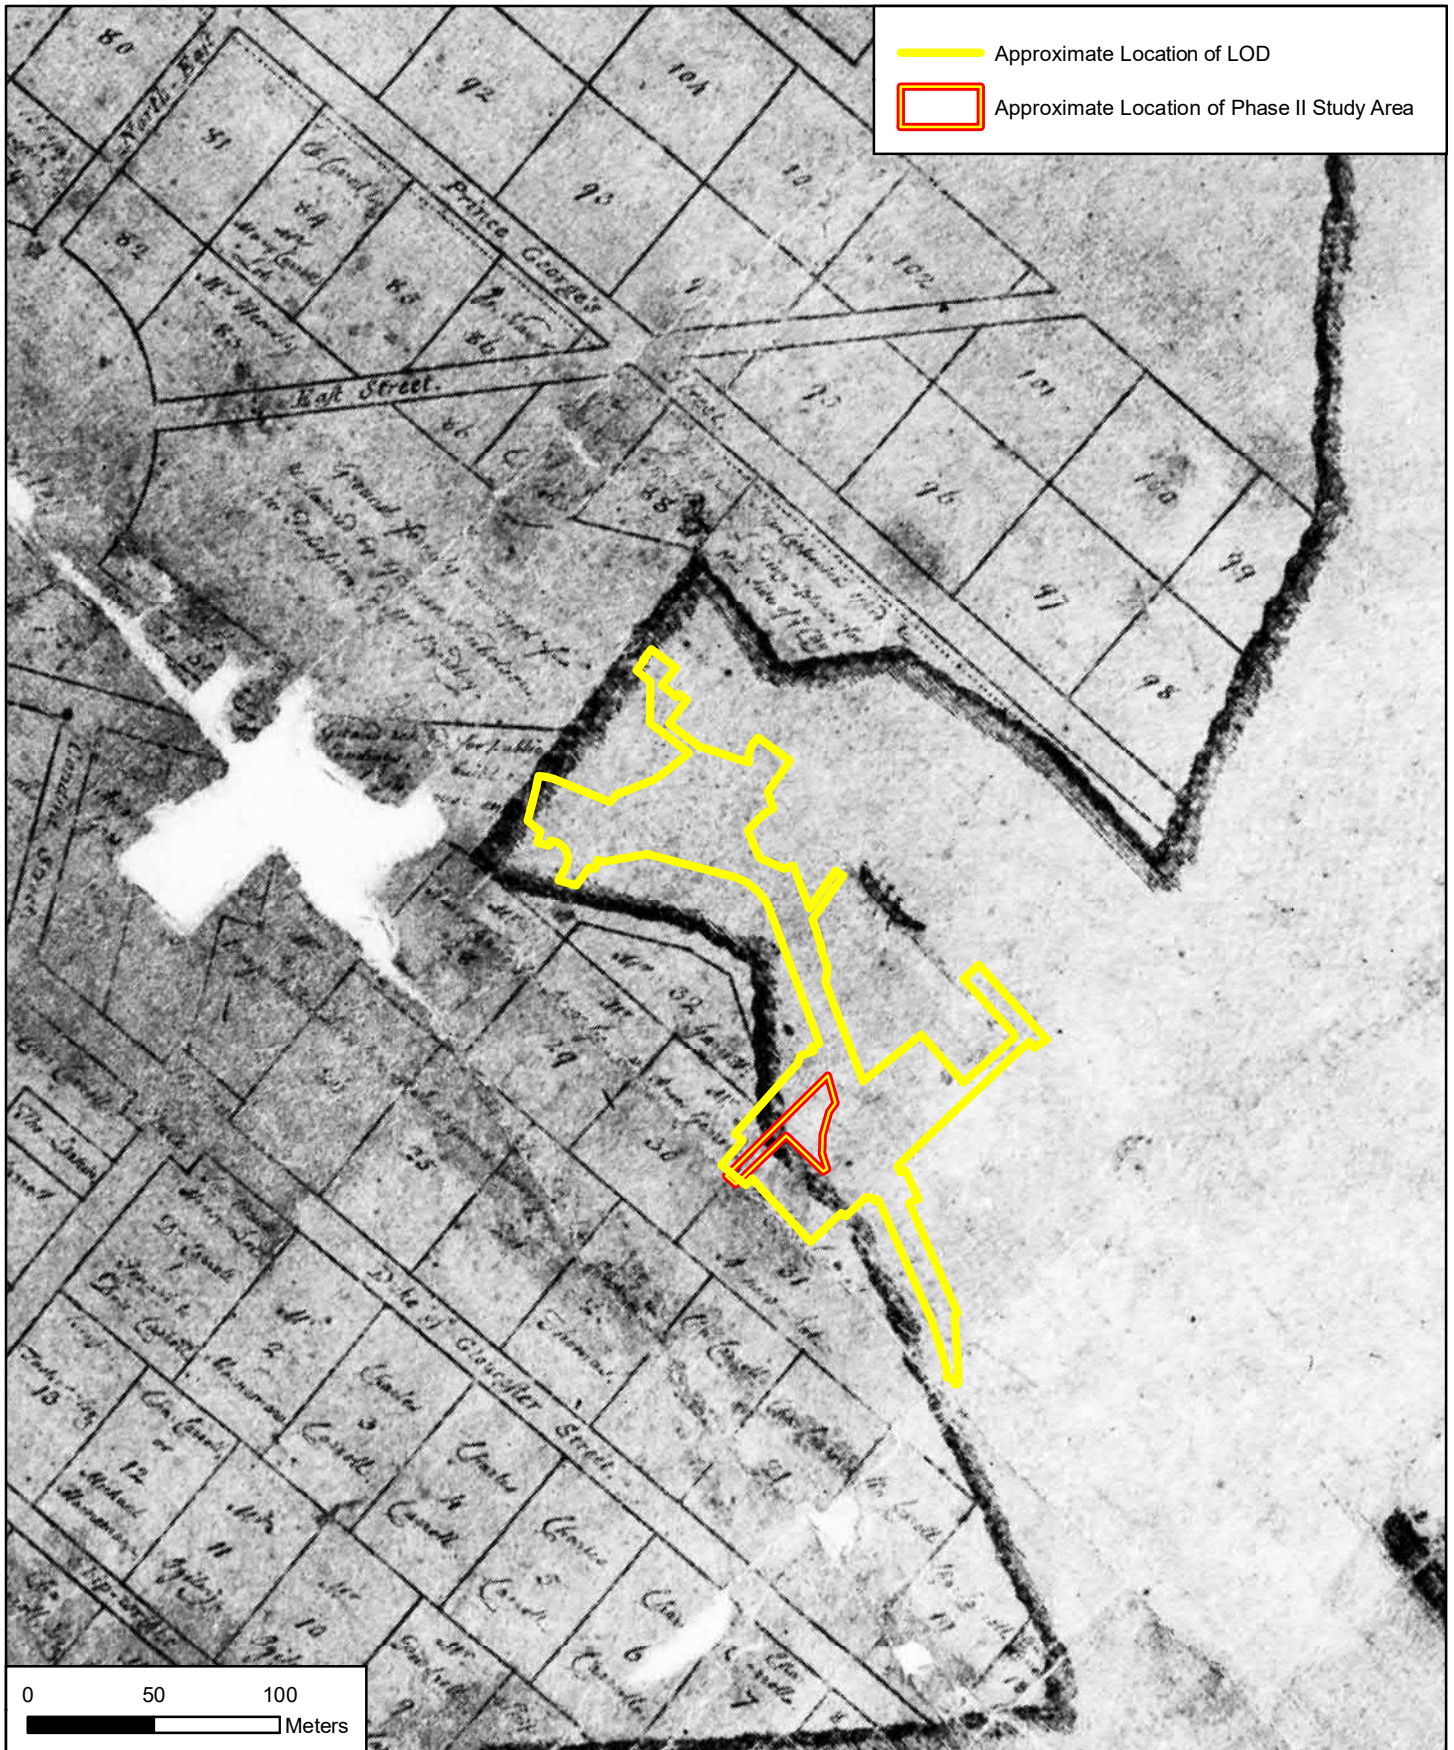

Within six years of Ridgeley's map, the City of Annapolis was officially founded laid out in accordance with Sir Francis Nicholson's 1695 town plan. While the original of this plan was not available for review, James Stoddard updated a copy in 1718, providing representations of the early road network and urban lot divisions (Figure 3-2). Critically, Stoddard's plan provides each lot's number and its contemporaneous owner. Later land records indicate that the LOD was part of what was once Lot 31, which Stoddard attributed to Charles Carroll, Esquire (owner of numerous lots southeast of Church Circle). Lot 31 was an elongated parcel located northeast of Duke of Gloucester Street and along what was at the time the shoreline of Dock Cove. Much of the current LOD, including all land east of the existing playground, would have been open water/tidal flats in 1718. Only the westernmost extent of the LOD would have been located on dry land approximately midway along the lot's water frontage.

The manner in which Charles Carroll, Esquire acquired the property, along with its previous ownership, is not clear. Lot 31 is not specified in any of the available land records predating Stoddard's 1718 plan, and while Charles Carroll, Esquire was a grantee for numerous lots in Annapolis before this time, the land transfer descriptions are often too vague to attribute to a particular property. Thus, while it is clear he purchased several lots in Annapolis prior to 1718, available land records provide no way to determine which transaction(s) would have included Lot 31.

Read (1990), citing the work of Baker (1983, 1986), describes two phases of Annapolis' growth during the late seventeenth and early eighteenth centuries. Between 1695 and 1705, merchants and planters quickly bought and sold most of the city lots. However, between approximately 1705 and 1720, the city's principal resident merchants, including Charles Carroll, Esquire, began purchasing large swaths of property in Annapolis. It may be reasonable to suspect that Charles Carroll acquired Lot 31 during this second growth period. Furthermore, if most of the city lots were bought and sold rather quickly prior to approximately 1705, it may be unlikely that Lot 31 exhibited any improvements during the late seventeenth and early eighteenth centuries. Indeed, it may have remained entirely unimproved during Charles Carroll, Esquire's period of ownership, as there is no documentary evidence currently available to suggest otherwise.

In a deed dated January 13, 1738, Charles Carroll, Esquire sold all of Lot 31 to Charles Carroll, Chysurgeon (also known as Dr. Charles Carroll) for £6 (Anne Arundel County Deed Book [AACDB] RD 3:114). The deed provides no description of the built environment or the property's usage at the time.

While Dr. Charles Carroll (1691-1755) was undoubtedly related to Charles Carroll, Esquire, the relationship is not entirely clear at present. The two are not immediate family members, but instead appear to be one or two degrees separated through the extended Carroll family. Dr. Charles Carroll arrived in Annapolis from Ireland in 1715. A Catholic by birth, he became a member of the Anglican church to avoid Maryland colonial law barring Catholics from public office. Professionally, he was a land speculator and medical doctor. He married Dorothy Blake on Maryland's Eastern Shore in 1722, with whom he had three children: Charles (1723-1783), John Henry (1732-1754), and Mary Clare (1727-1781) (Mount Clare Museum House 2007).

The property containing the LOD descended to his son Charles, though the will or deed of transfer was not available for review. It is likely that his son, who as an adult was known as Charles Carroll, Barrister, acquired the property shortly after his father's death in 1755. After receiving an English education at Eton, the University of Cambridge, and the Inns of Court, Charles Carroll, Barrister returned to Annapolis shortly before his father died. His inheritance was vast and instantly made him one of Maryland's wealthiest aristocrats. He later filled his father's seat in the Lower House of the Maryland Assembly as an Anne Arundel County Delegate and in 1763 married Margaret Tilghman of Talbot County. Prior to and during the American Revolutionary War, Charles Carroll, Barrister held several high political offices, ultimately serving in Congress and the first State Senate (Mount Clare Museum House 2007).

During Charles Carroll, Barrister's ownership of the LOD, the earliest evidence for the LOD's potential use and occupation was included in a deed with William Logan. On November 10, 1767, Carroll leased all of Lot 31 to Logan for a 99-year term at £6 7 shillings (s) 6 pence (d) per annum (AACDB BB 3:772-774). The deed noted that Logan, a barber and peruke maker (wigmaker), already occupied the property at the time the lease was drafted; whether this was a purely domestic occupation or if it incorporated some commercial aspect of his stated profession is not clear.

Whatever the nature of the occupation, it appears that the extant building stock was perhaps limited in extent and/or quality, as Carroll specifically stipulated that Logan was to erect a "good and sufficient dwelling house forty feet in length and eighteenth feet in wide and one stable twenty four feet square" (AACDB BB 3:773). The deed went on to note that Logan was actively constructing a wharf somewhere along the property's shoreline, said wharf reverting to Carroll's ownership in the event the lease was annulled. This detail indicates that the property still fronted

the water at this time and presumably differed little from its boundaries as shown on Stoddard's 1718 plan. The only exception to Logan's otherwise free and clear use of the property was access to a small spring that Carroll reserved for watering his cattle. These details illustrate how the emerging proto-urban environment retained a mixture of distinctly rural uses (animal husbandry) alongside domestic and commercial/mercantile interests.

A description of Logan's wharf and warehouse was provided when he advertised the property for sale in 1779:

The wharf at present occupied by the State of Maryland will be sold for 87 years to come it is made of stone the foundation 14 feet thick is 50 feet in front, 112 feet in back with a warehouse on it 20' x 23. Rooms on the upper story and has a chimney with two fireplaces...The front of the wharf has water sufficient for vessels of the largest berth that come this way and which will be sold for £6000 continental currency" (quoted in Hopkins 1985).

No records for the precise locations of Logan's warehouse, wharf, or home were identified.

Logan's reference to the State of Maryland's occupation of his wharf and warehouse may have been an attempt to entice a buyer by advertising the governmental lease. However, the Maryland Navy provided to be a poor tenant, according to Logan's descriptions of the damages they caused as he sought redress from the state in 1780. He complained that approximately 225 feet of cub stone was gone, that 100 tons of stone had been dumped in front of the wharf rendering it useless, and that the Navy damaged the windows, stairs, and wood planking of his warehouse (Hopkins 1985). Later in 1780, the Council of Maryland, recognizing the damages done to Logan's wharf and warehouse, determined that "the State is bound to make good the Damages arising since they were employed by them, and direct an Order to be drawn to the said William Logan for the sum of six thousand Pounds" (Journal and Correspondence of the Council of Maryland 1780).

Logan posted at least two subsequent advertisements in local periodicals as he attempted to sell the wharf, warehouse, and remainder of his property at Lot 31. In the May 19, 1785 edition of the *Maryland Gazette*, Logan offered the following for sale:

LOGAN'S WHARF, 60 feet front and 100 depth, with a 20 feet square house, rented as a blacksmith's shop at 20 pounds a year; also a brick house, 3 stories high, with 6 rooms in it, a passage 12 feet wide, and four fire places; likewise a garden 200 feet deep (*Maryland Gazette* 1785:3).

Logan was evidently unsuccessful, as another advertisement for the property appeared in the *Maryland Gazette* two years later. While many of the property details are identical, the second advertisement included some additional insights:

To be SOLD by WILLIAM LOGAN, in Annapolis, on the 18th day of October, HIS wharf, which is 120 feet in front at 12 feet water, also the lot, which runs 350 feet back on Walnut street, and a brick house 3 stories high, 30 by 23, 6 rooms in it, 4 fire places, a kitchen and a never failing spring, the brick house fronts Water street; also a wooden house 28 by 20, with two fire places in it" (*Maryland Gazette* 1787:3).

Again, the sale was unsuccessful. Two months to the day after his final sale advertisement, a notice appeared in the *Maryland Gazette* indicating that Logan had petitioned the Chancellor of Maryland

for insolvency relief. Logan's bankruptcy, together with his inability to transfer Lot 31 to another party, led to the Carroll family's reclamation of property.

By this time, however, Charles Carroll, Barrister was deceased, and it appears from subsequent deed records that the property passed to his eponymous relative Charles Carroll. Some deeds identify him as Charles Carroll of Carrollton, while others identify him as Charles Carroll, Esquire; it is not clear if these names were meant to represent the same individual. Regardless, Charles Carroll leased the property to John Adam Boyer by a deed dated January 15, 1791 for a term of 75 years (AACDB NH 5:546-547). The only structural improvement specifically addressed was the wharf, but it is reasonable to suspect that the property may have included some or all of the other improvements noted only four years earlier in William Logan's advertisement. For the next seven years, John Adam Boyer ran a tannery business on Lot 31, though no details regarding the lot's structural improvements or appearance are known from his tenure. Historic maps, while available from the period, are too widely scaled to show any details of the city, let alone Lot 31's built environment.

On February 7, 1798, Allen Quynn, administrator for John Adam Boyer, sold the entirety of Lot 31 to John Hyde for £2 6s 6d (AACDB NH 9:84-85). John Hyde's father, Thomas Hyde, was Boyer's former employer and it appears that John continued using Lot 31 as a residence and tannery (Hopkins 1985). Any structural improvements related to either Boyer's or Hyde's tanning business were not listed in the deed, which only specified the property's "buildings and improvements...together with a wharf formerly built by a certain William Logan thereto adjoining) (AACDN NH 9:84).

John Hyde was enumerated on the 1798 Federal Direct Tax List (Direct Tax) as a resident of Annapolis (Direct Tax 1798). By the time of the assessment (October 1, 1798), Hyde had already taken possession of Lot 31, and while this lot is not specifically named in the Direct Tax, Hyde is only listed as owning one Annapolis property. Therefore, it is likely that his property tax entries refer to his occupation of Lot 31.

The Direct Tax's general list, specifically devoted to dwellings and outhouses (outbuildings), did not capture any other elements of the built environment (e.g., tannery buildings). Hyde's property, listed at just over 2.3 acres, included one dwelling house and two outhouses valued at \$600. The Direct Tax's particular list provided additional descriptive information, describing the real property as one two-story brick dwelling house measuring 28 by 20 feet with a single-story brick ell measuring 16 by 12 feet along with two frame outhouses measuring 16 by 12 feet (Direct Tax 1798).

Hyde's name also appeared under the Direct Tax's general list for the assessment of enslaved people. According to these records, he owned one person exempt from taxation (likely due to age or disability) and three other taxable enslaved people between the ages of 3 and 50. Contradicting this record, the particular list for enslaved taxable people lists Hyde as owning one taxable individual, with no other information provided (Direct Tax 1798).

Hyde (1763-1819) was enumerated on the 1800 U.S. Federal Census (Census) as the head of a household that included a total of 14 individuals (Ancestry.com 2019a). Among these were eight white males, four white females, and two enslaved people. The household ages skewed young, with five members under the age of 16 and only two over the age of 25. While names and relations are not given, it is reasonable to assume that these would have included his wife, Sarah Jane Wells (1768-1826) and most, if not all, of their children, including Daniel Hyde (1797-1876) who would

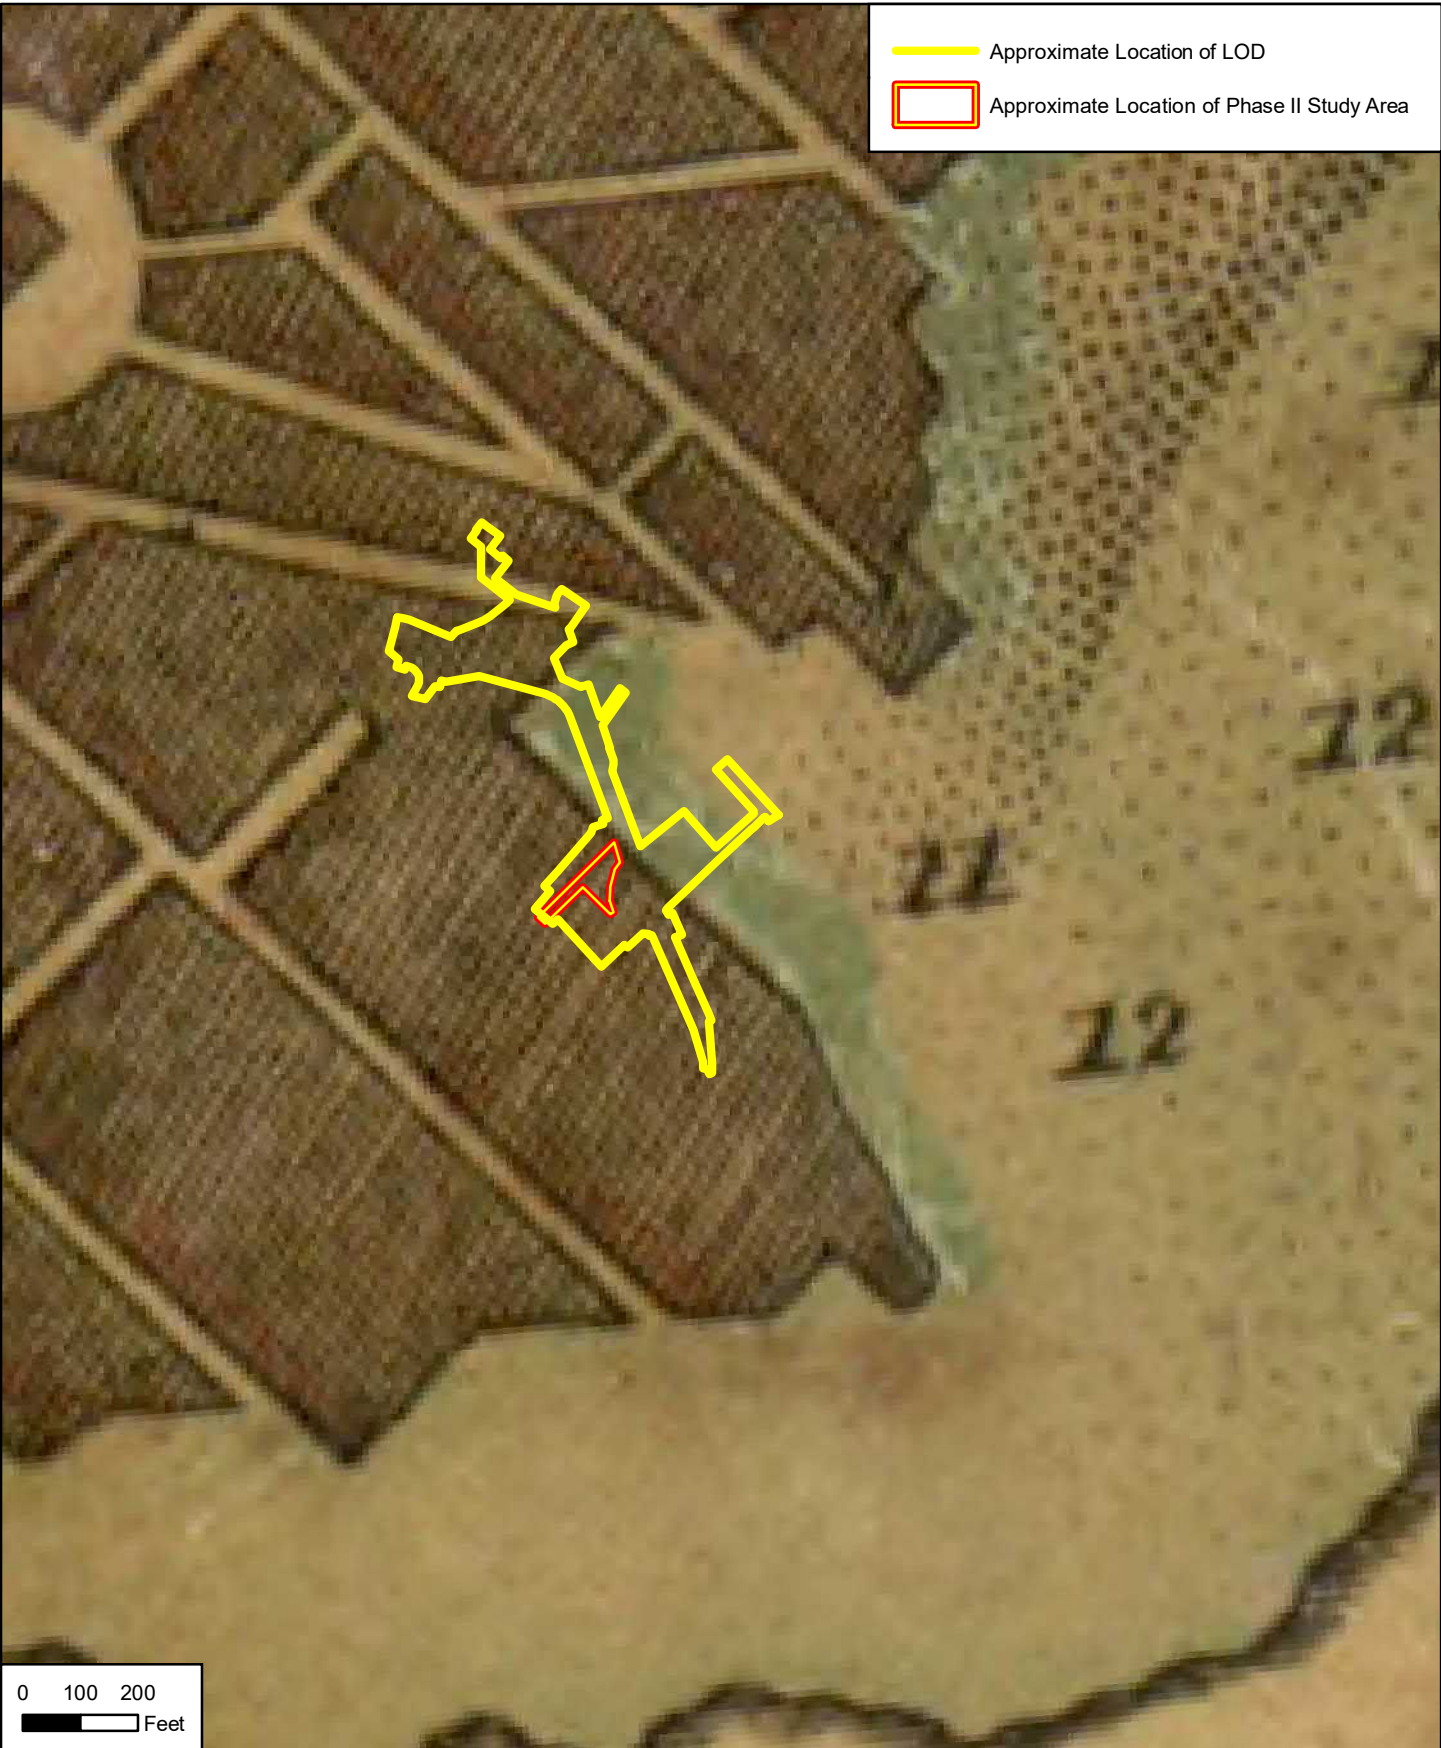

eventually inherit Lot 31 (Ancestry.com 2019b). On the 1810 Census, Hyde appears along with 11 other people, all of whom are given as free white individuals (Ancestry.com 2019c). No occupations are noted, but John Hyde repeatedly placed advertisements in Easton, Maryland's *Republican Star* periodical from at least 1807 to 1816 requesting all varieties of "tanners bark" indicating he continued operating a tannery during this time (GenealogyBank.com 2019).

Upon John Hyde's death in 1819, his property passed to his wife, Sarah. His will, dated July 19, 1819 conferred upon her an undescribed house and lot in Annapolis, stipulating that they were to pass to their son Daniel Hyde upon her death (Anne Arundel County Will Book JG 3:55-56). That same year, Brantz and Fielding issued a map of part of the Chesapeake Bay that included a detailed rendering of Annapolis (Figure 3-3). This only shows the layout of the city's principal streets and none of its individual structures, preventing a meaningful characterization of the real property John Hyde left to his family. However, this map provides a general depiction of the Dock Cove shoreline and adjacent road network, which is a useful aid for determining when the land east of the current playground was infilled. Georeferencing the LOD's approximate boundaries relative to the map suggest that portions of the LOD between the playground and what is now Compromise Street were still open water. Compromise Street was clearly not yet built by the time this map was issued, indicating that the land reclamation event that formed most of the LOD postdates 1819.

Both Daniel and Sarah Hyde appear as separate heads of household on the 1820 Census, suggesting each was living in a separate residence (Ancestry.com 2019d). It is possible that the property at Lot 31 contained more than one dwelling, or perhaps one or the other was living elsewhere at the time. Later mapping indicates that Daniel was a resident of Lot 31 for some, if not all, of his life, while there is no record that definitively links Sarah to the property after the death of her husband. Daniel Hyde's entry includes eight free white individuals, of whom two were engaged in manufacturing (presumably inclusive of Daniel as a tanner). Sarah Hyde's household was considerably larger, including 14 people, among whom were six enslaved individuals and one person employed in manufacturing. By the time of the 1830 Census, Sarah was deceased and Daniel was head of a 15-person household, inclusive of three enslaved individuals (Ancestry.com 2019e).

On August 8, 1834, Daniel Hyde enlarged Lot 31's original boundaries when he acquired 12,000 square feet of additional property from William and Ann Mason (AACDB WSG 19:431-433). No improvements were noted in the deed, and while the boundaries were provided, they are not tied to any surviving component of the historic landscape and cannot be rectified with the current environment. The deed does note, however, that the property boundaries come within 12.5 feet of the northeast corner of Daniel Hyde's brick dwelling house, but the house's location on the property is not clear. This property remained as a separately-deeded parcel from the time it left the Hyde family following Daniel's 1876 death into the early twentieth century. Subsequent deeds, which only account for a fraction of this 12,000-square-foot parcel, indicate that it fronted Compromise Street and encompassed part of the LOD. At the time Daniel acquired this new property, it is unclear if Compromise Street was extant, though it is known to have been built no later than 1837 (Hopkins 1985). Since Compromise Street was not shown on the 1819 Brantz and Fielding Map, the land reclamation event(s) that created it (as well as the majority of the LOD) must have occurred between 1819 and 1837.

By the time of the 1840 Census, Daniel's household had expanded to include 17 individuals, of whom eight were enslaved and two were employed in manufacturing (Ancestry.com 2019f). Daniel likely continued to work as a tanner, taking full advantage of the business his father left to

him. However, before the decade was through, it became clear that Daniel was losing interest in maintaining daily involvement in his Annapolis tannery. On February 7, 1848, he offered the property for rent in an extensive and very detailed advertisement in the *Sun*, reproduced here in full for its vivid depiction of the contemporaneous built environment:

TAN-YARD FOR RENT.—The undersigned, wishing to retire from the Tanning Business, offers for RENT his TAN YARD in the city of Annapolis, Maryland. This establishment is inferior to none in the state, having every convenience for an extensive business. The situation is the most desirable in the city, it being immediately upon the water, and has never been without a full stock of Bark since its erection, and has been said by many to be the most desirable property at the seat of Government. The Yard, proper, has 51 Layaway Vats, six Latches, four Limes, and two Pools. The Handling House has six Layaways and six Latches. The Beam House is large enough for three Beams, and has two Bates; a first rate Finishing Shop, with Tables and everything complete. A Mill House, 25 feet square, with one of the best Mills I have ever seen, and is new, with Sole Leather and Upper Leather Lofts for Drying; a Sale Shop; Foreman's House and Hands' House, and a large Salting House; Sheds sufficient to hold two hundred cords of bark; with Stabling for four horses; in short, there cannot be found a more convenient and desirable establishment in the State. Immediately adjoining is a Lot, upon which is a Stone Mill for grinding dry Hides; a Glue Shed, &c.

The DWELLING is a fine Brick, with three finished stories, brick Kitchen, Meat House, and every convenience for a family. The Dwelling has two first-rate Leather Cellars, with two Patent Sole Leather Rollers. A further description is deemed unnecessary, as those disposed to rent, will examine the premises. I have some 4 or 500 Green Hides on hand, which the renter shall have in such way, and on such terms as would be to his advantage. I have several Hands, first rate Tanners, which I would let at moderate prices, and would make myself useful to an industrious tenant (Hyde 1848).

His first attempt to rent the property was evidently unsuccessful, as a nearly identical advertisement appeared in the March 1, 1849 edition of the *Sun* (Hyde 1849). He may have had success following the 1849 appeal for a renter, as he was listed as a Merchant, not a Tanner, on the 1850 Census and did not appear on that census' Manufacturing Schedule (Ancestry.com 2019g). This was the first census to name all members of the household, which included his wife Ann Hyde (52), their children Charles (25), Susanah (17), Elijah (15), and Daniel (13), and a woman named Ann Merian (aged 71) who likely was Daniel's mother-in-law. According to the Slave Schedule of the same year, Daniel enslaved seven individuals, including two females and five males, ranging in age from 4 to 65 years old.

On March 10, 1875, Daniel and Ann Hyde, together with Elias and Francis Hyde, mortgaged a large part of the parcel Daniel originally acquired in 1834 to Mary Hays (AACDB SH 9:157-159). Daniel was indebted to her for \$2,000, and as a condition of the debt's repayment, a mortgage for this property was given to Mary Hays for \$1 to secure payment on the debt. By this time, the 1834 parcel contained two lots known as Nos. 2 and 3 Compromise Street, both of which would have been located in the northeast corner of the LOD. The mortgage describes the two lots as being adjacent, sharing 48 feet of street frontage and extending west-southwest 75 feet, and each

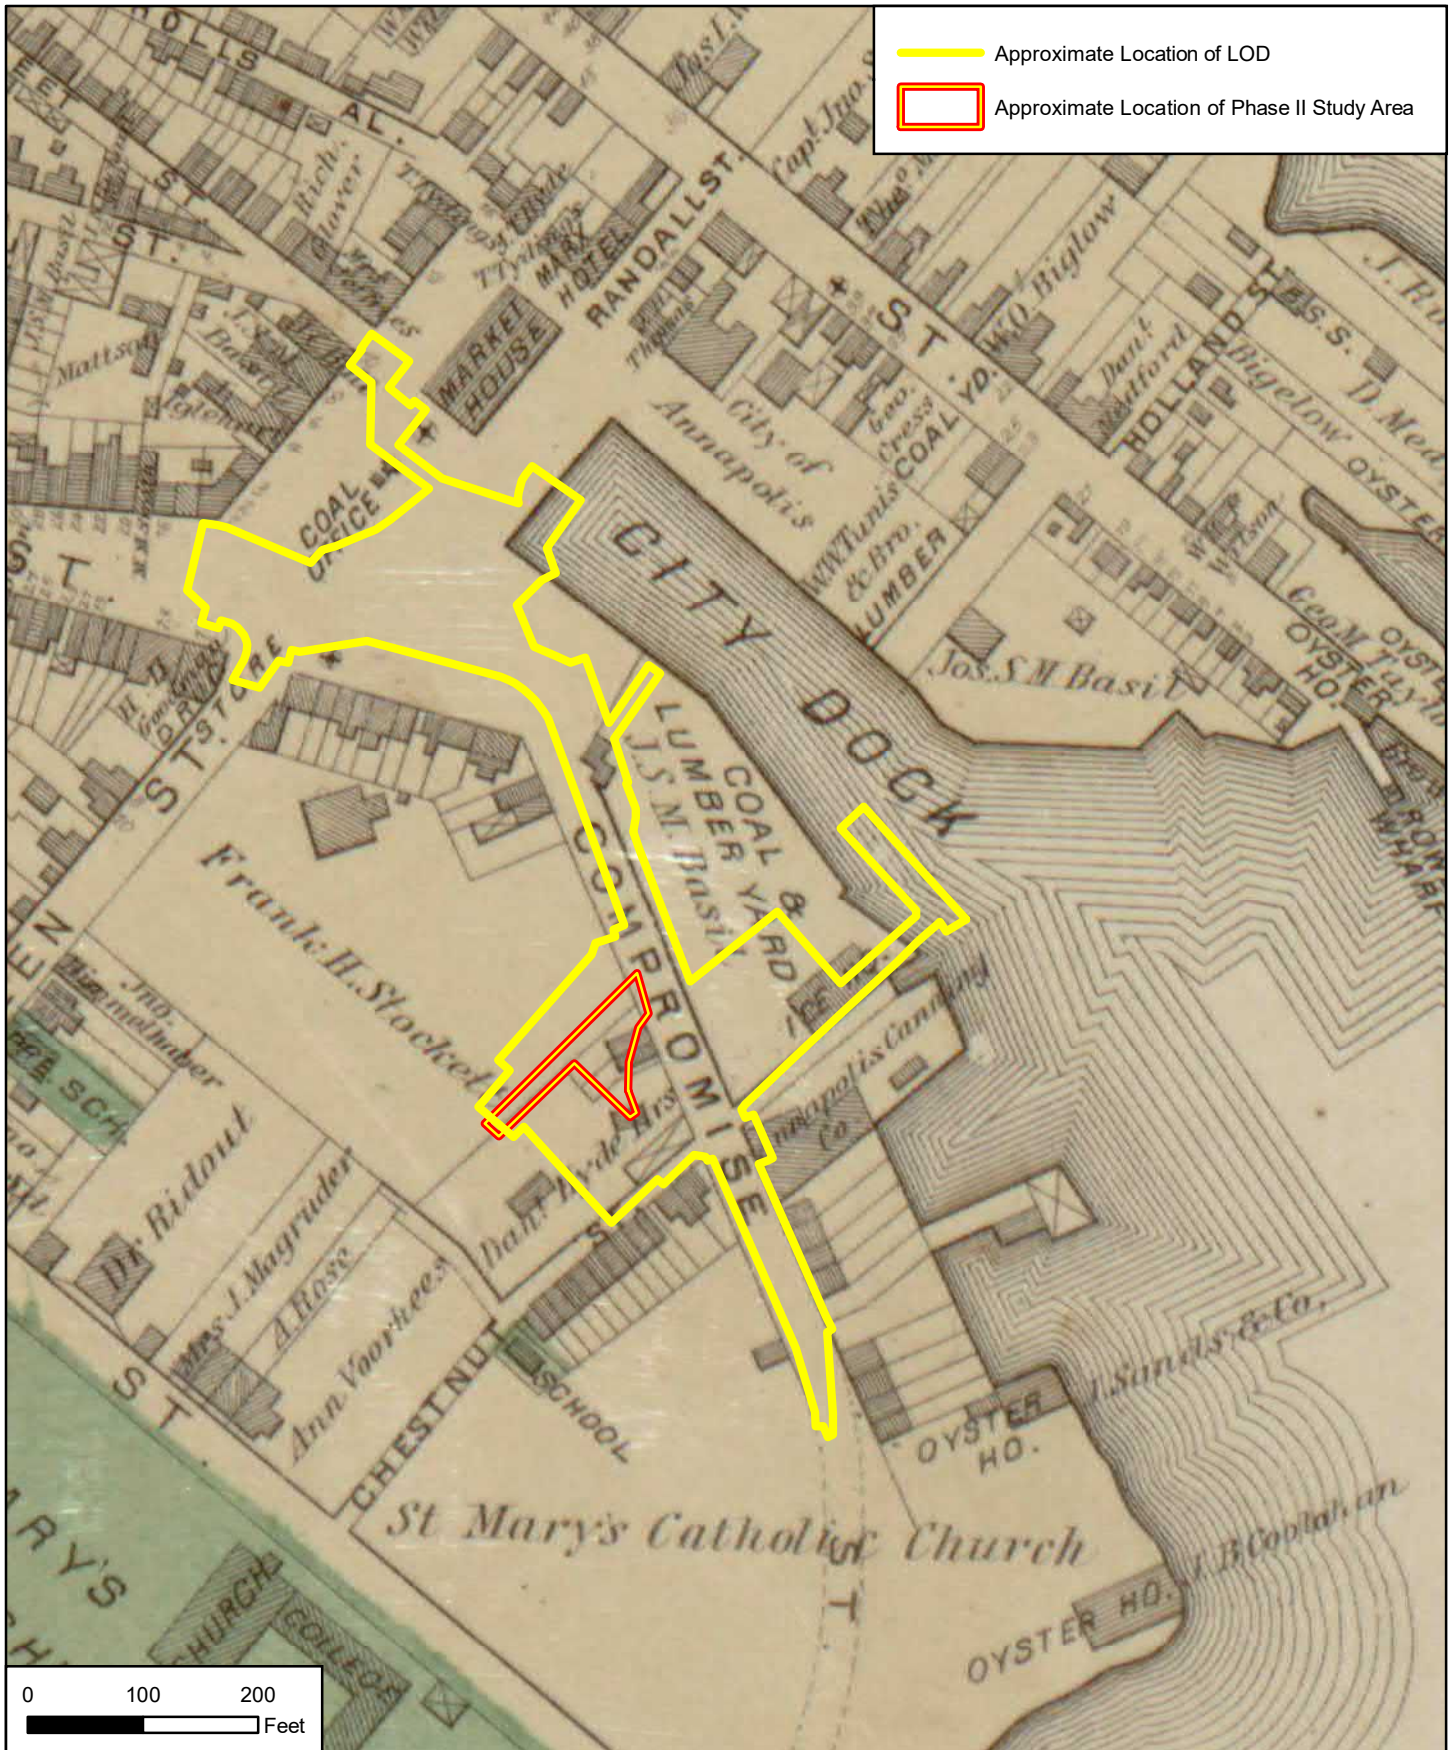

containing a two-and-a-half-story frame dwelling. Following a default on the mortgage, attorney N. Rufus Gill sold the house and lot at No. 3 Compromise Street to Susannah Purdy for \$525 in a deed dated June 3, 1876 (AACDB SH 22:277-278). He sold No. 2 two years later, on December 10, 1877, to William Smith for \$560, at which time the property still contained the two-and-a-half-story frame dwelling (AACDB SH 12:183-184).

By the time Nos. 2 and 3 were sold off from Lot 31, however, Daniel Hyde was deceased. The remainder of his property was then litigated as part of the Anne Arundel County Circuit Court case Edward P. Suter, trustee et al. vs. Ann C. Hyde et al. As a result, James Revell was appointed trustee and charged with selling Daniel's residual real estate. In a deed dated June 6, 1879, Revell sold the property to John B. Flood for \$1,780 (AACDB SH 14:328-329). Shortly before this sale, the property was rendered with a moderate amount of detail on Hopkins' 1878 atlas of Anne Arundel County (Figure 3-4). This map indicates that the entire west half of Lot 31 was owned by Ann Voorhees (record of sale not located), with Daniel Hyde's heirs in possession of that portion of the lot between Compromise Street to the east and a small unnamed alley to the west; two shaded buildings, possibly residences or part of the former tannery complex, can be seen in the east- and west-central portions of the property, with what is likely an elongated shed at the corner of Compromise and Chestnut (Newman) streets. In the north corner of the lot, two buildings fronting Compromise Street are clearly visible on their own lots. These represent Nos. 2 and 3 Compromise Street, owned at the time by William Smith and Susannah Purdy, respectively.

By the time of the 1880 Census, portions of the LOD were owned by three separate families: the Floods, the Smiths, and the Purdys. John and Rebecca Flood, both aged 24, held the largest share and lived at No. 1 Compromise Street along with a 7-year-old female African-American servant named Alice Larkins. John was listed as a coal burner, while Rebecca kept house. At No. 2 Compromise Street, the Smith family included William (aged 52) as head of a household that included his wife Emma (47), their sons Benjamin (22) and Charles (5), and a stepson Elias H. Weedon (15). William was listed as a waterman and Benjamin an engineer, with Emma keeping house and Elias at school. No. 3 Compromise Street housed the Purdy family, which included head of household Richard (aged 48), his wife Susanna (40), their daughter Kate Smith (25), their son Richard (21), Kate's husband Richard (29?), and a grandson Walter Smith (less than a year old). The elder Richard clerked at a hotel, the younger Richard was a shoemaker, Richard Smith was a machinist, Kate Smith was a boarder, and Susanna kept house (Ancestry.com 2019h).

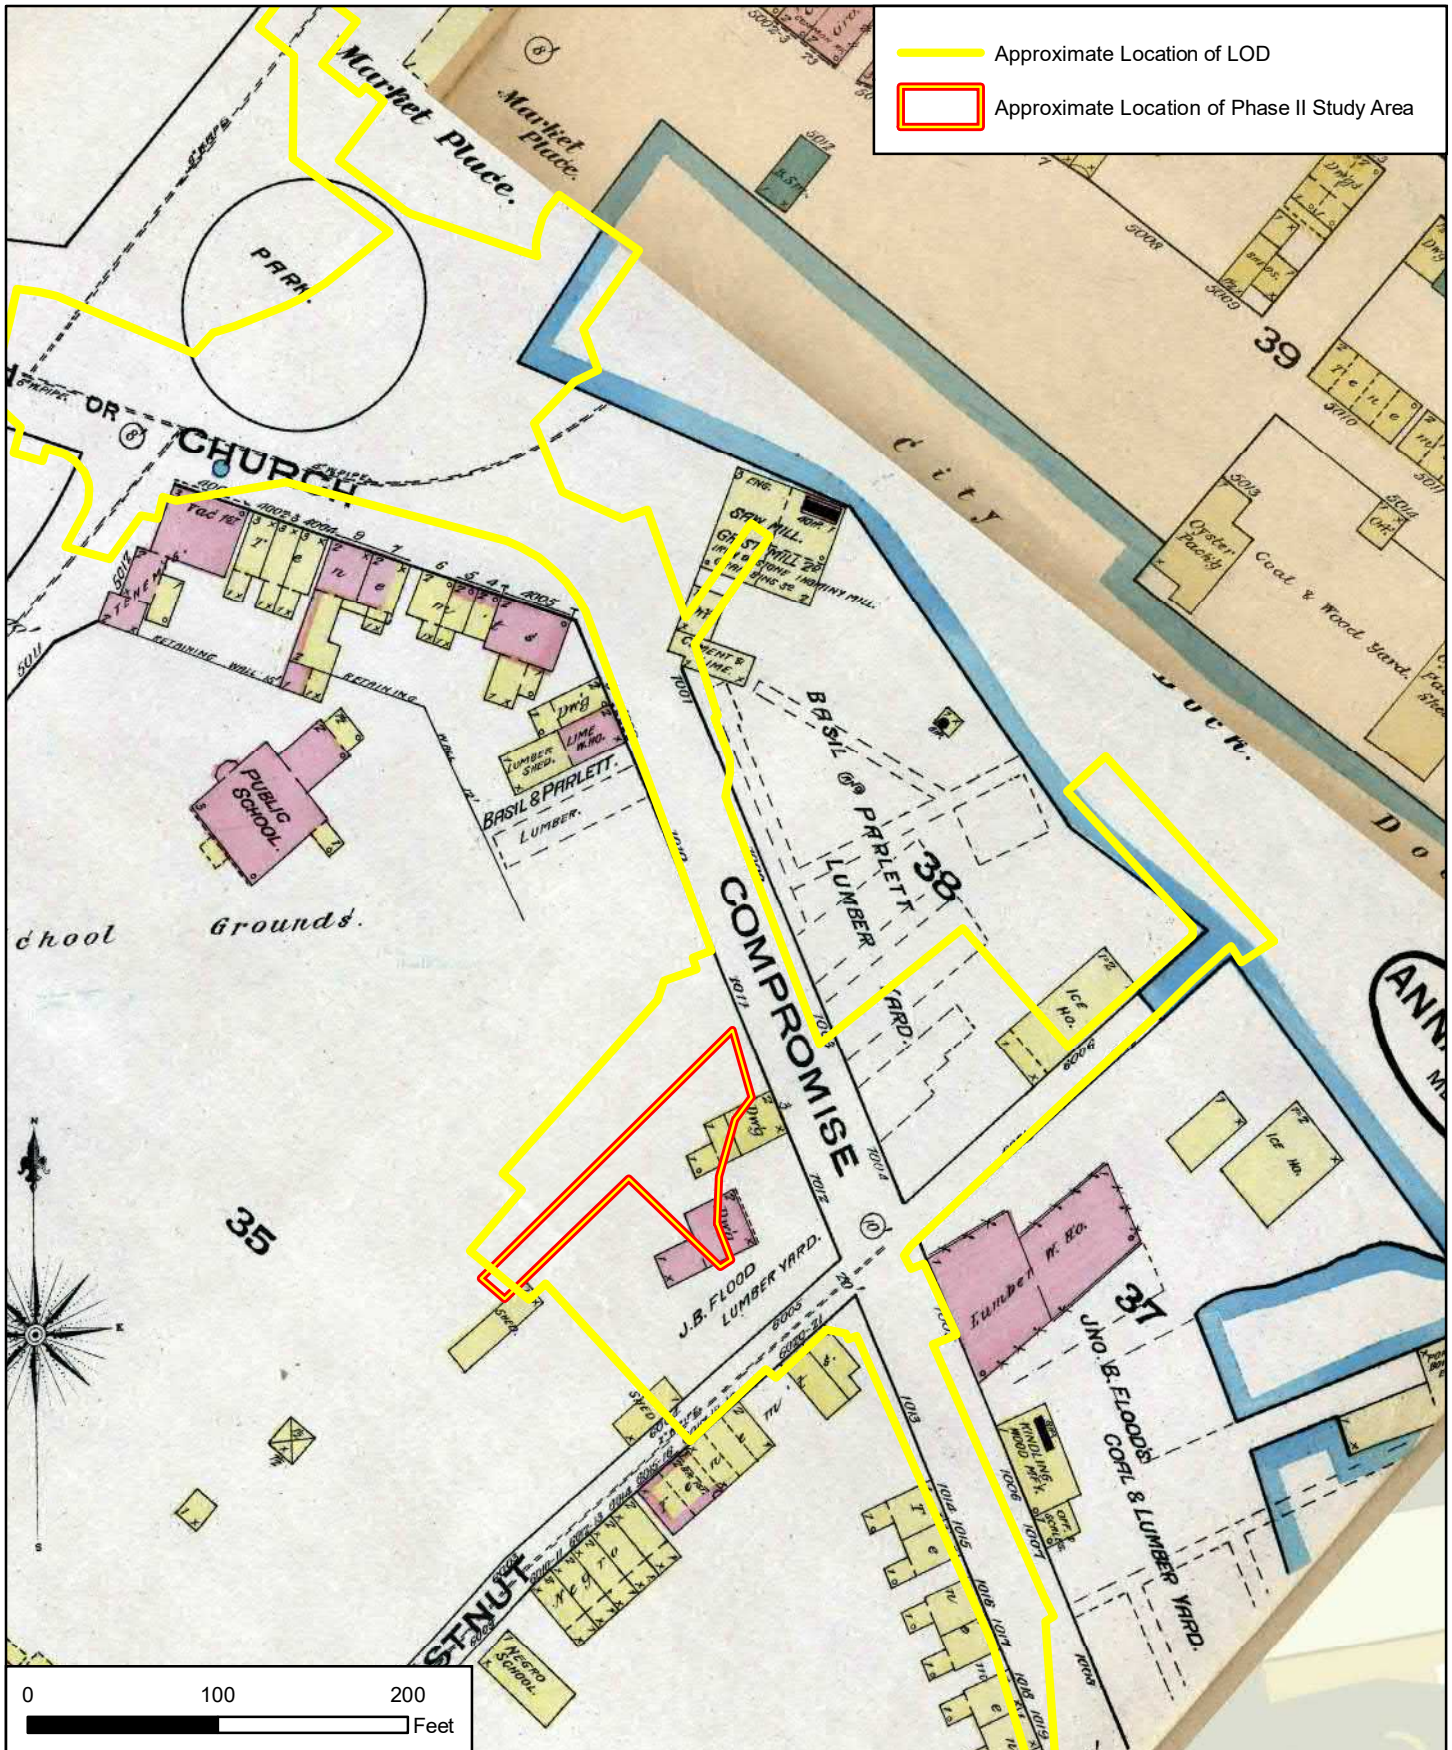

By December 1, 1884, John B. Flood and his wife Rebecca, along with James and Jane Smith, were indebted to the Farmers National Bank of Annapolis for thousands of dollars in joint loans the four cosigned together. In order to settle these debts, James Revell was appointed trustee and authorized to sell the debtors real estate in the event they could not meet the pay schedules to which they were obligated (AACDB SH 24:666-670). The collateral real estate included that which John B. Flood acquired from James Revell in 1879 and which included most of the current LOD. It does not appear that John B. Flood immediately defaulted on his portion of the debt, as it was not until 1891 that James Revell sold the property (AACDB SH 39:323-324).

In 1885, the Sanborn Map Company (Sanborn) issued the earliest available map to provide a highly detailed depiction of the built environment within and adjacent to the LOD (Figure 3-5). The LOD encompasses several buildings, including a two-story frame dwelling at No. 3 Compromise Street, a two-story brick dwelling to the south, and two single-story sheds. The 1878 Hopkins atlas shows a similar arrangement of buildings, though the sizes and positions are slightly different; this is almost certainly the result of difference in scale and mapping methods evident between the two

maps. The property is described on the Sanborn map as the J.B. Flood Lumber Yard, though no information regarding this company was found in the 1880 Census Manufacturing Schedule, contemporary periodicals, or business listings.

No. 2 Compromise Street, which William Smith acquired in 1877, erroneously was not represented on the 1885 Sanborn map. Smith's will, dated January 3, 1885, conveyed "the 2 ½ Story Frame House on Compromise Street...known as House No. 2" to his wife, Emma, and after her death to their son, Charles (AACWB JWB 1:84). The Sanborn map was not produced until June of 1885, initially suggesting that No. 2's absence may be a product of its demolition between January and June 1885. It appears, however, is that Nos. 2 and 3 were incorrectly represented as a single dwelling and assigned the No. 3 address. Subsequent maps assign this building two separate street numbers and show it to have been two distinct dwellings.

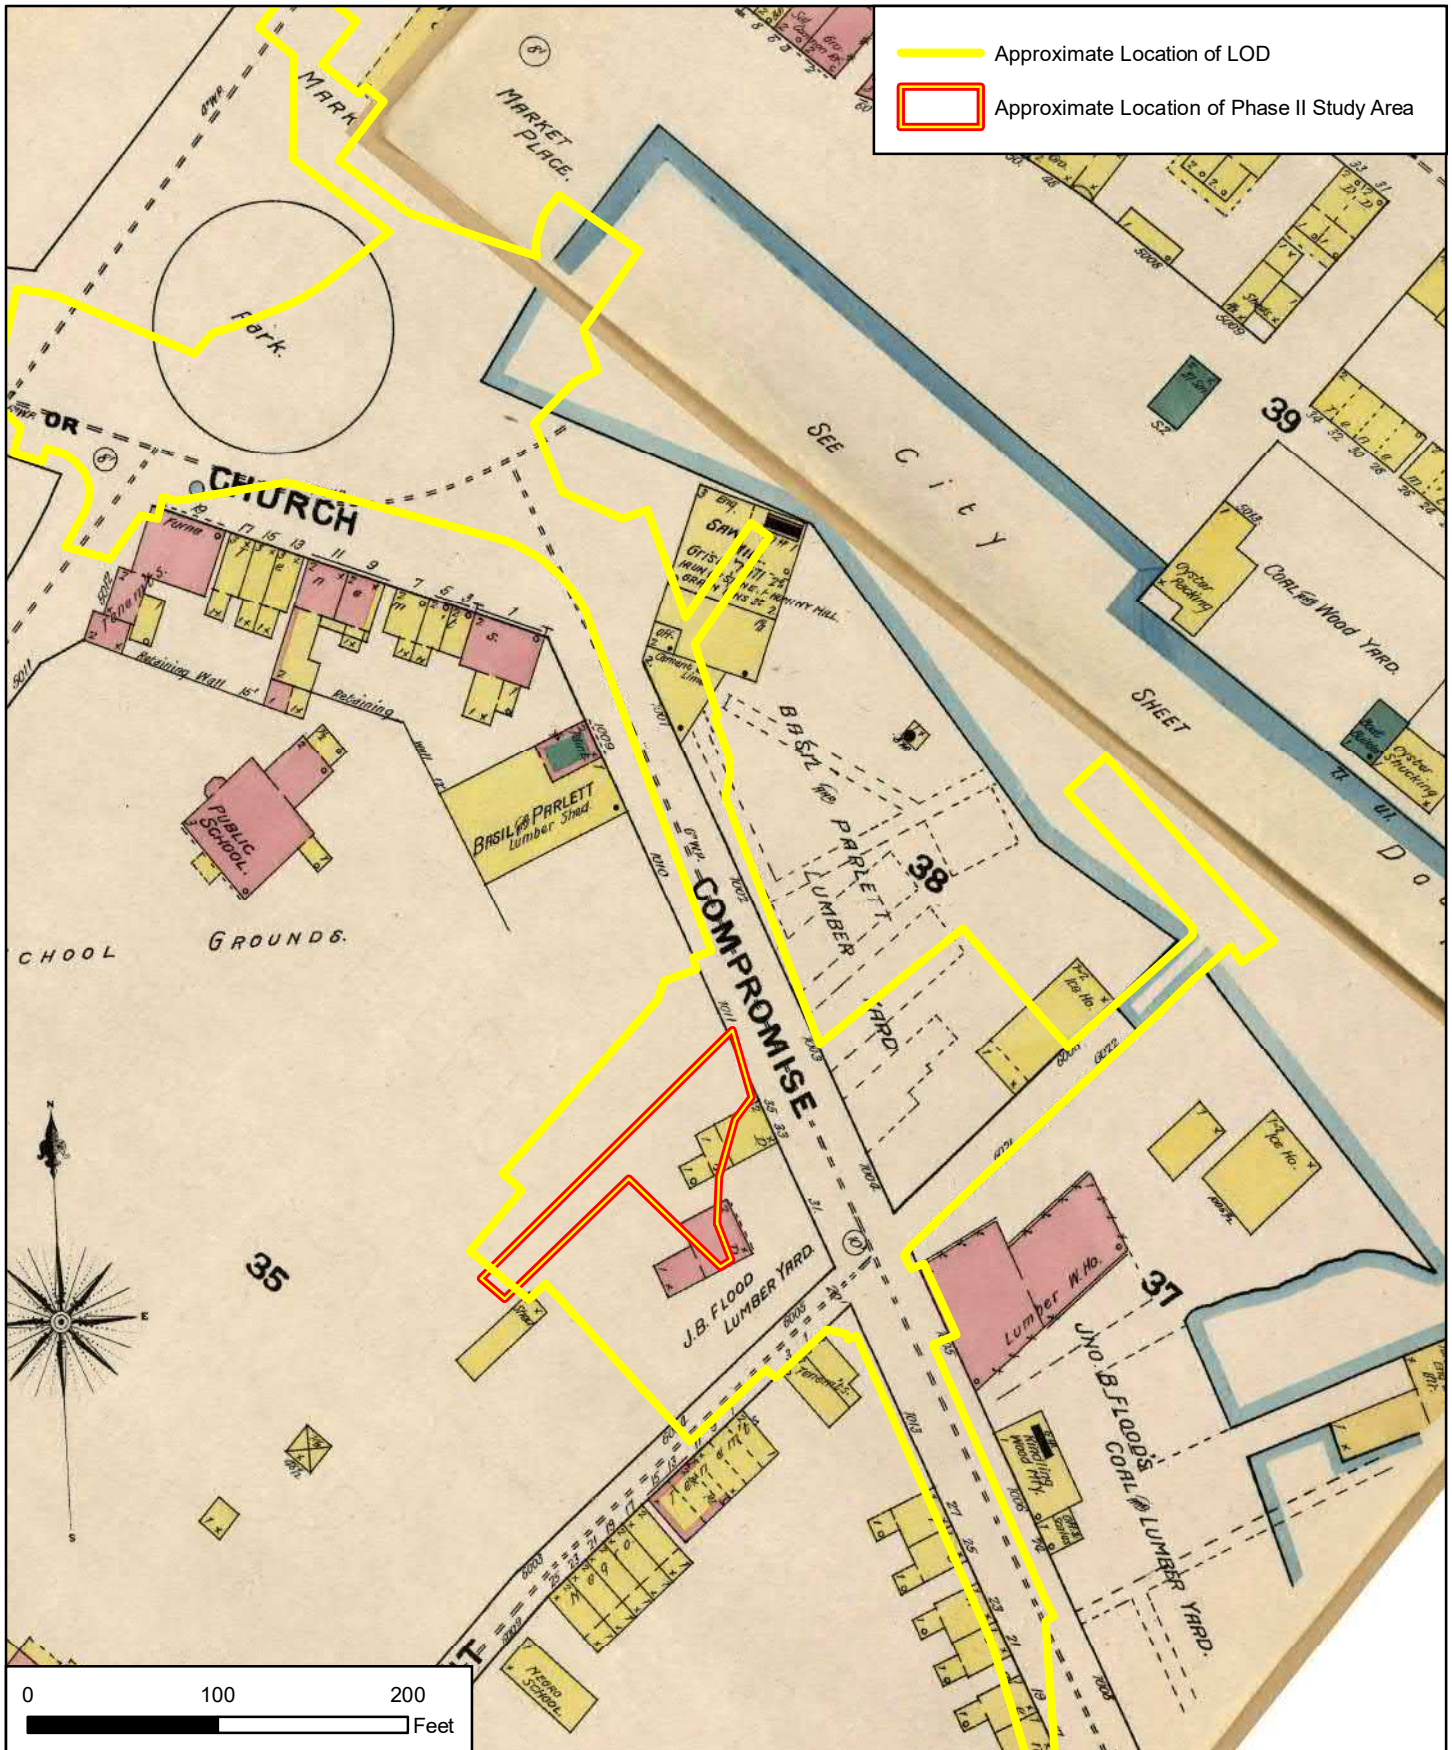

James Revell, trustee from the previous 1884 deed, finally sold the subject property in a deed dated August 6, 1891 to Abram P. McCombs for \$1,700 (AACDB SH 39:323-324). While the buildings were not described, the property was noted as having 72 feet 9 inches of frontage along Compromise Street and 229 feet 7 inches on Chestnut Street. This encompasses all of the LOD except its northeast corner, which was still owned by the Purdy and Smith families this time.

The 1891 Sanborn reflects the built environment at the time of McCombs' purchase (Figure 3-6). The only significant change within the LOD, since the 1885 Sanborn map was issued, was the loss of the shed shown along Chestnut Street in 1885. The property is still identified as part of the J.B. Flood Lumber Yard.

Moderate changes are also evident on the 1897 Sanborn map (Figure 3-7). The dwelling at No. 33/35 Compromise Street (originally Nos. 2 and 3) was altered slightly when a small, single-story frame addition was appended to the south side of its ell. The adjacent brick dwelling at No. 31 Compromise Street was substantially remodeled, however, as a half-story was added to the main block and the rear ell entirely demolished and replaced with one-and-a-half-story brick and one-story frame additions. Twenty-four feet to the rear of the property, two single-story frame buildings potentially representing sheds/outhouses also were constructed by this time.

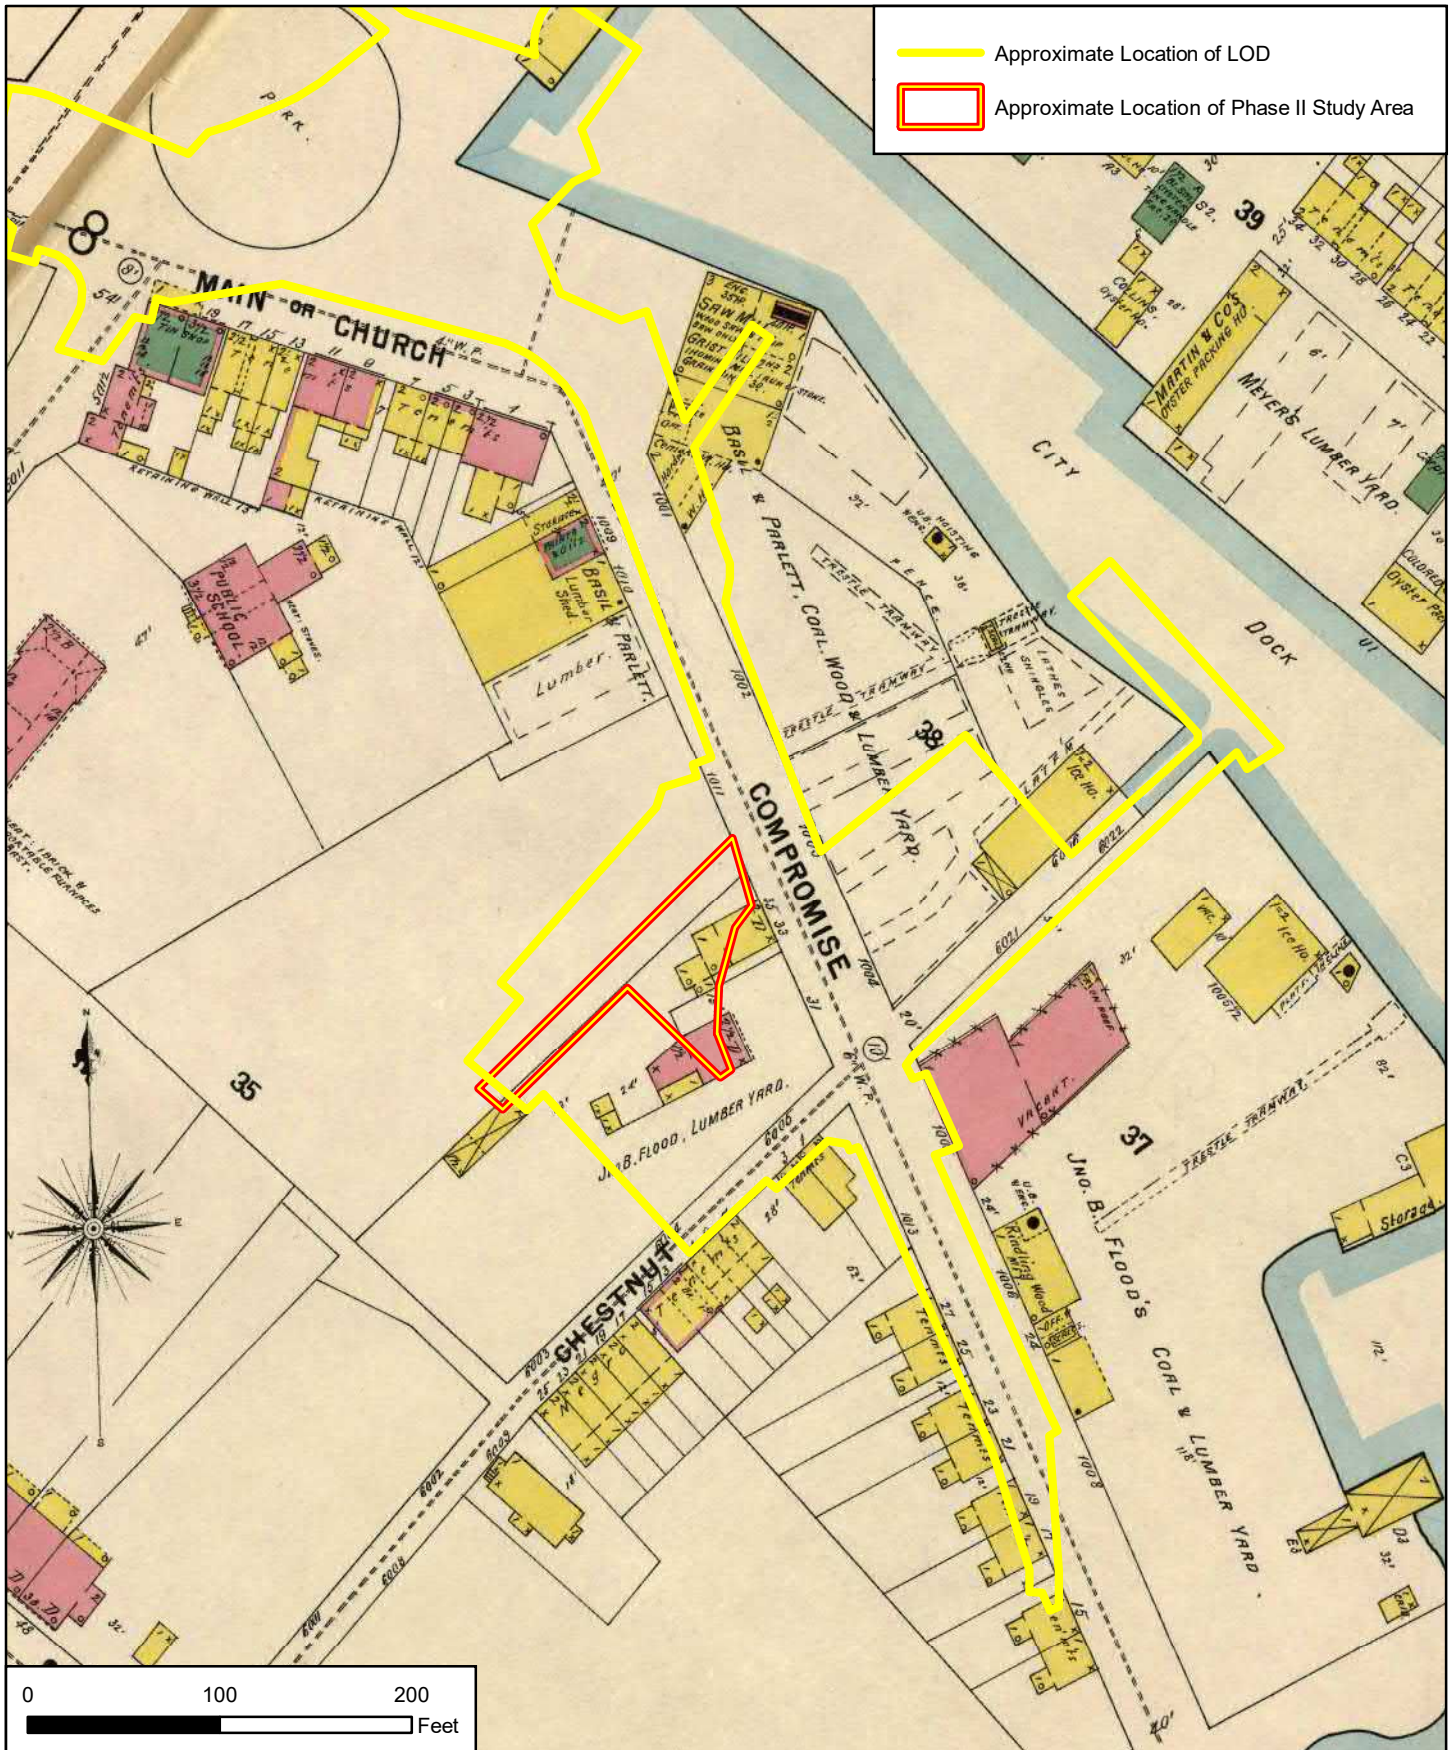

While Abram McCombs owned No. 31 Compromise Street at the turn of the twentieth century, census records indicate he did not live there. The 1900 Census lists seven members of the Dove family as occupants, include Thomas (age 46) as head of a household including his wife, Elizabeth (47), their four children (13 to 20), and one grandson (4). Occupations were only listed for Thomas and his son Vinton, the former serving on the city commission and the latter working as a day laborer. At No. 33 Compromise Street (formerly No. 2), Charles W. Smith (24) and his wife Arabella (23) lived alongside Charles' mother, Emma (67). Charles was listed as a merchant. No. 35 Compromise Street (formerly No. 3), jointly owned by siblings Kate Smith and Richard Purdy, was rented to Fannie Dunker (aged 65) and her son, Edward (38). The latter worked as a waterman (Ancestry.com 2019i).

A decade after he purchased it, McCombs sold the 0.435-ac property to Henry B. Myers for \$2,500 on March 28, 1901 (AACDB GW 20:414-415). The northeast portion of the LOD, at the time owned by the Purdy family, was also transferred in 1891. Susannah Purdy, who purchased the property from Daniel Hyde in 1875, died intestate and the property descended to her son, Richard, and daughter Kate Smith (nee Purdy). In a deed dated December 27, 1901, Richard Purdy conveyed his half-interest in the property to his sister Kate for \$250 (AACDB GW 24:152-153). The property was noted as having 24 feet of frontage along Compromise Street and was about 75

feet deep, but otherwise lacks boundary or improvements descriptions. The size, though, is the same as the No. 3 Compromise Street lot their mother purchased in 1875.

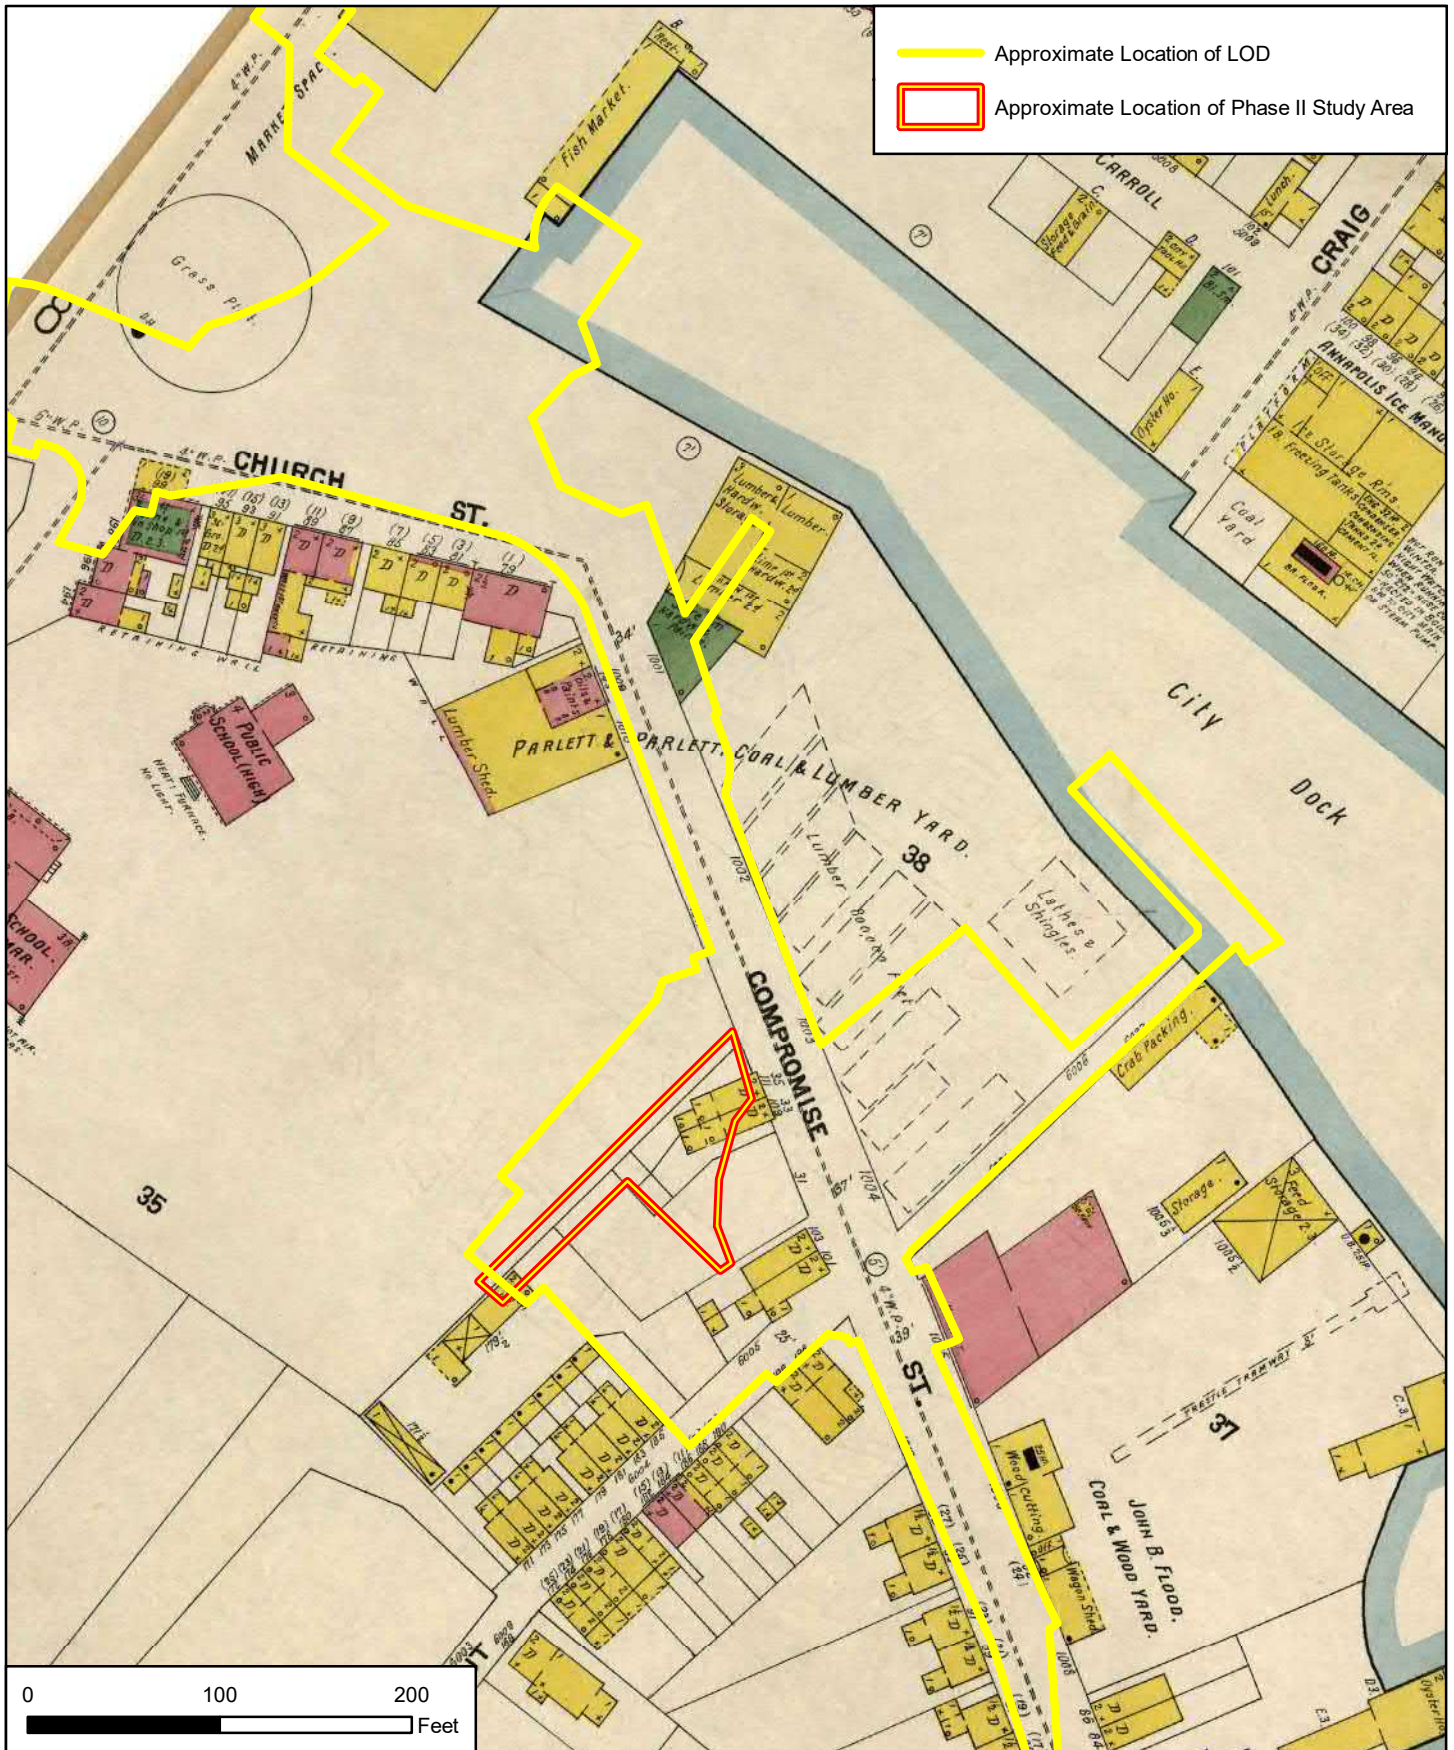

Within two years, Henry Myers and his wife, Elizabeth, sold a portion of the property located west of the LOD to Ella Basil for \$2,000 (AACDB GW 30:18-19). While this does not impact the project area history and will not be pursued in the chain-of-title, it is mentioned to illustrate how the property shrank over time as it approached its current dimensions. A Sanborn map produced in 1903 illustrates the LOD and the changes to its built environment since 1897 (Figure 3-8).

Within the northeast corner of the LOD, the two-story frame dwelling at Nos. 33/35 Compromise Street was shown as having been divided into two adjacent residences. At the rear of the dwellings, single-story frame additions appear to have been newly constructed or adapted/expanded from the addition evident on preceding Sanborn maps. Changes within the remainder of the LOD, part of Myers' property, are notable. The brick dwelling shown on the 1897 Sanborn at No. 31 Compromise Street is not represented, but this is an erroneous omission; it appears on subsequent Sanborn maps. At the west end of the LOD, a former shed was replaced with a one- to two-story frame wagon house that partially overlaps the shed's footprint. At the intersection of Compromise and Chestnut streets two new two-story frame dwellings with one-story frame additions/outbuildings were constructed as Nos. 101 and 103 Compromise Street. A row of eight two-story frame buildings with single-story outbuildings/additions are also apparent along the north side of Chestnut Street, of which only the easternmost unit (No. 185 Chestnut Street) falls within the LOD. The remainder of the LOD is shown as vacant space and for the first time since 1885 the property is not attributed to John B. Flood's lumber yard.

The Myers family retained the remainder of the property, inclusive of all but the northeast corner of the LOD, until 1907. On February 16 of that year, they sold it to Isaac Silver (AACDB GW 54:158-159). The deed noted it was an irregularly shaped parcel with an overall 228 feet of frontage along Chestnut Street and 72.5 feet along Compromise Street encompassing 0.435 ac. Kate Smith still retained ownership of the northeast corner of the LOD as a separate parcel at this time.

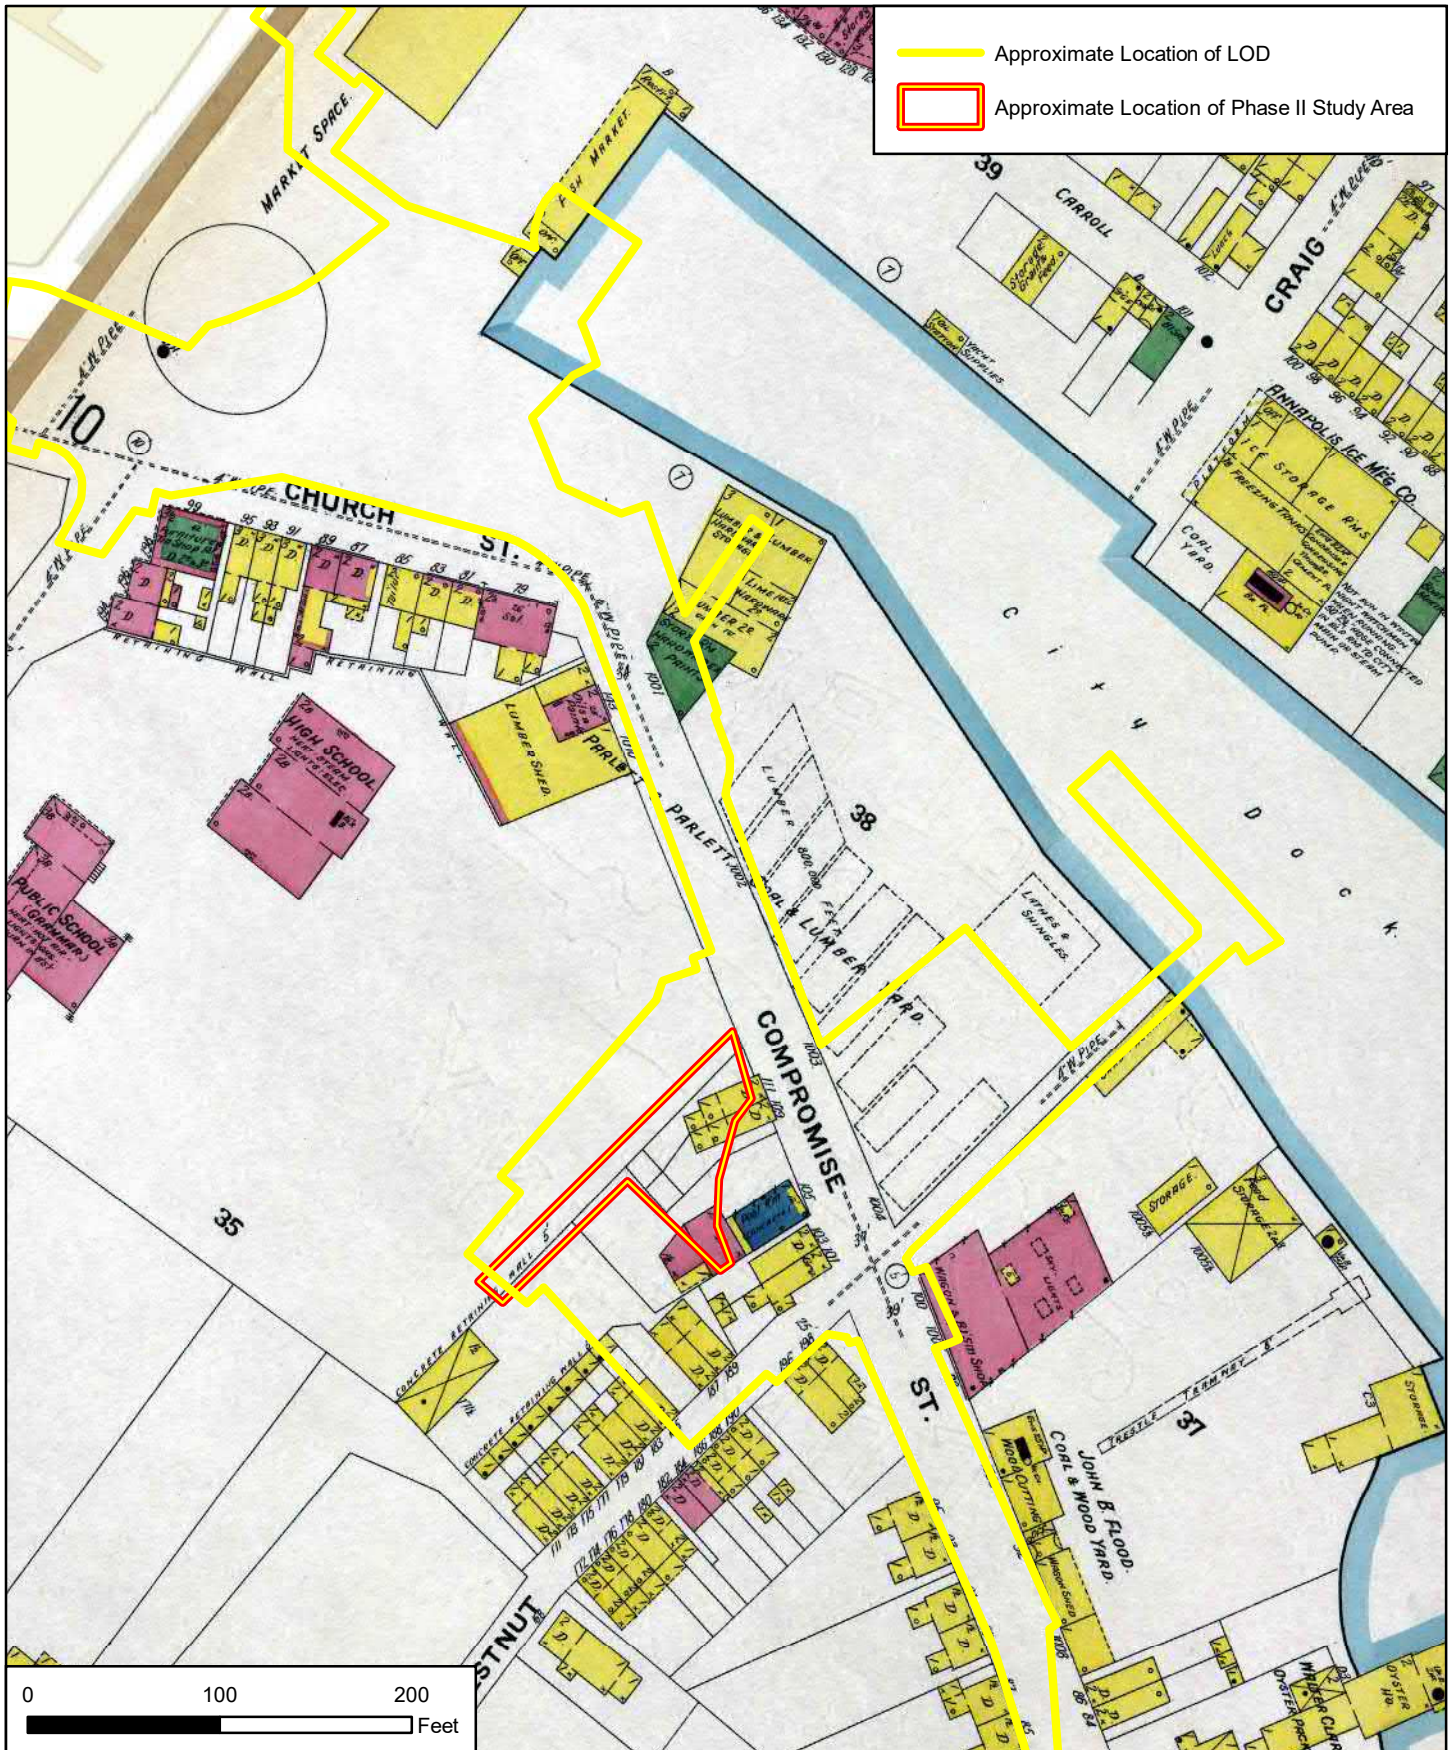

The 1908 Sanborn map shows all of the buildings depicted in 1903 along with several new additions (Figure 3-9). Along Chestnut Street, two two-story frame dwellings were constructed as Nos. 187 and 189, while the brick dwelling at No. 105 Compromise street had a single-story concrete "Pool Room" (billiards) added to its northeastern elevation. Though not a structural change, the former dwelling at 101 Compromise Street was converted into a grocery.

According to the 1910 Census, none of the LOD's three contemporaneous property owners (Charles Smith, Kate Smith, and Isaac Silver) lived at their Compromise/Chestnut Street properties (Ancestry.com 2019j). The eight separate residences that would have fallen within the LOD at the time, including Nos. 101 through 111 Compromise Street and Nos. 185 through 189 Chestnut Street, were therefore rentals. Of these, only the locations of Nos. 105, 109, and 111 Compromise Street were accessible for archaeological investigation during the current study and their census entries are accordingly provided. At No. 105 (formerly No. 31), which would have been owned by Isaac Silver, John Wintley (age 31) was listed as head of a household that included his wife, Mary B. (31), their son Joseph (15), and adopted children John Fisher, Jr. (age 9) and Roy C. Fisher (11). John Wintley was the only member of the family with a listed occupation, given simply as "odd jobs". At No. 109 (formerly No. 33), owned by Charles and Arabella Smith, Philip E. Mitchell

(age 35) was listed as the head of a household including his wife, Mary J. (35), and a boarder named George Gootee (27). Philip worked as a waterman. At No. 111 (formerly No. 35), owned by Kate Smith, were five members of the Thomas family. These included Louis (53) as the head of household along with his daughter Bessie (7) and sons Robert (18), Valentine (15), and Charles (7). The census notes that Louis worked as a waterman (Ancestry.com 2019j).

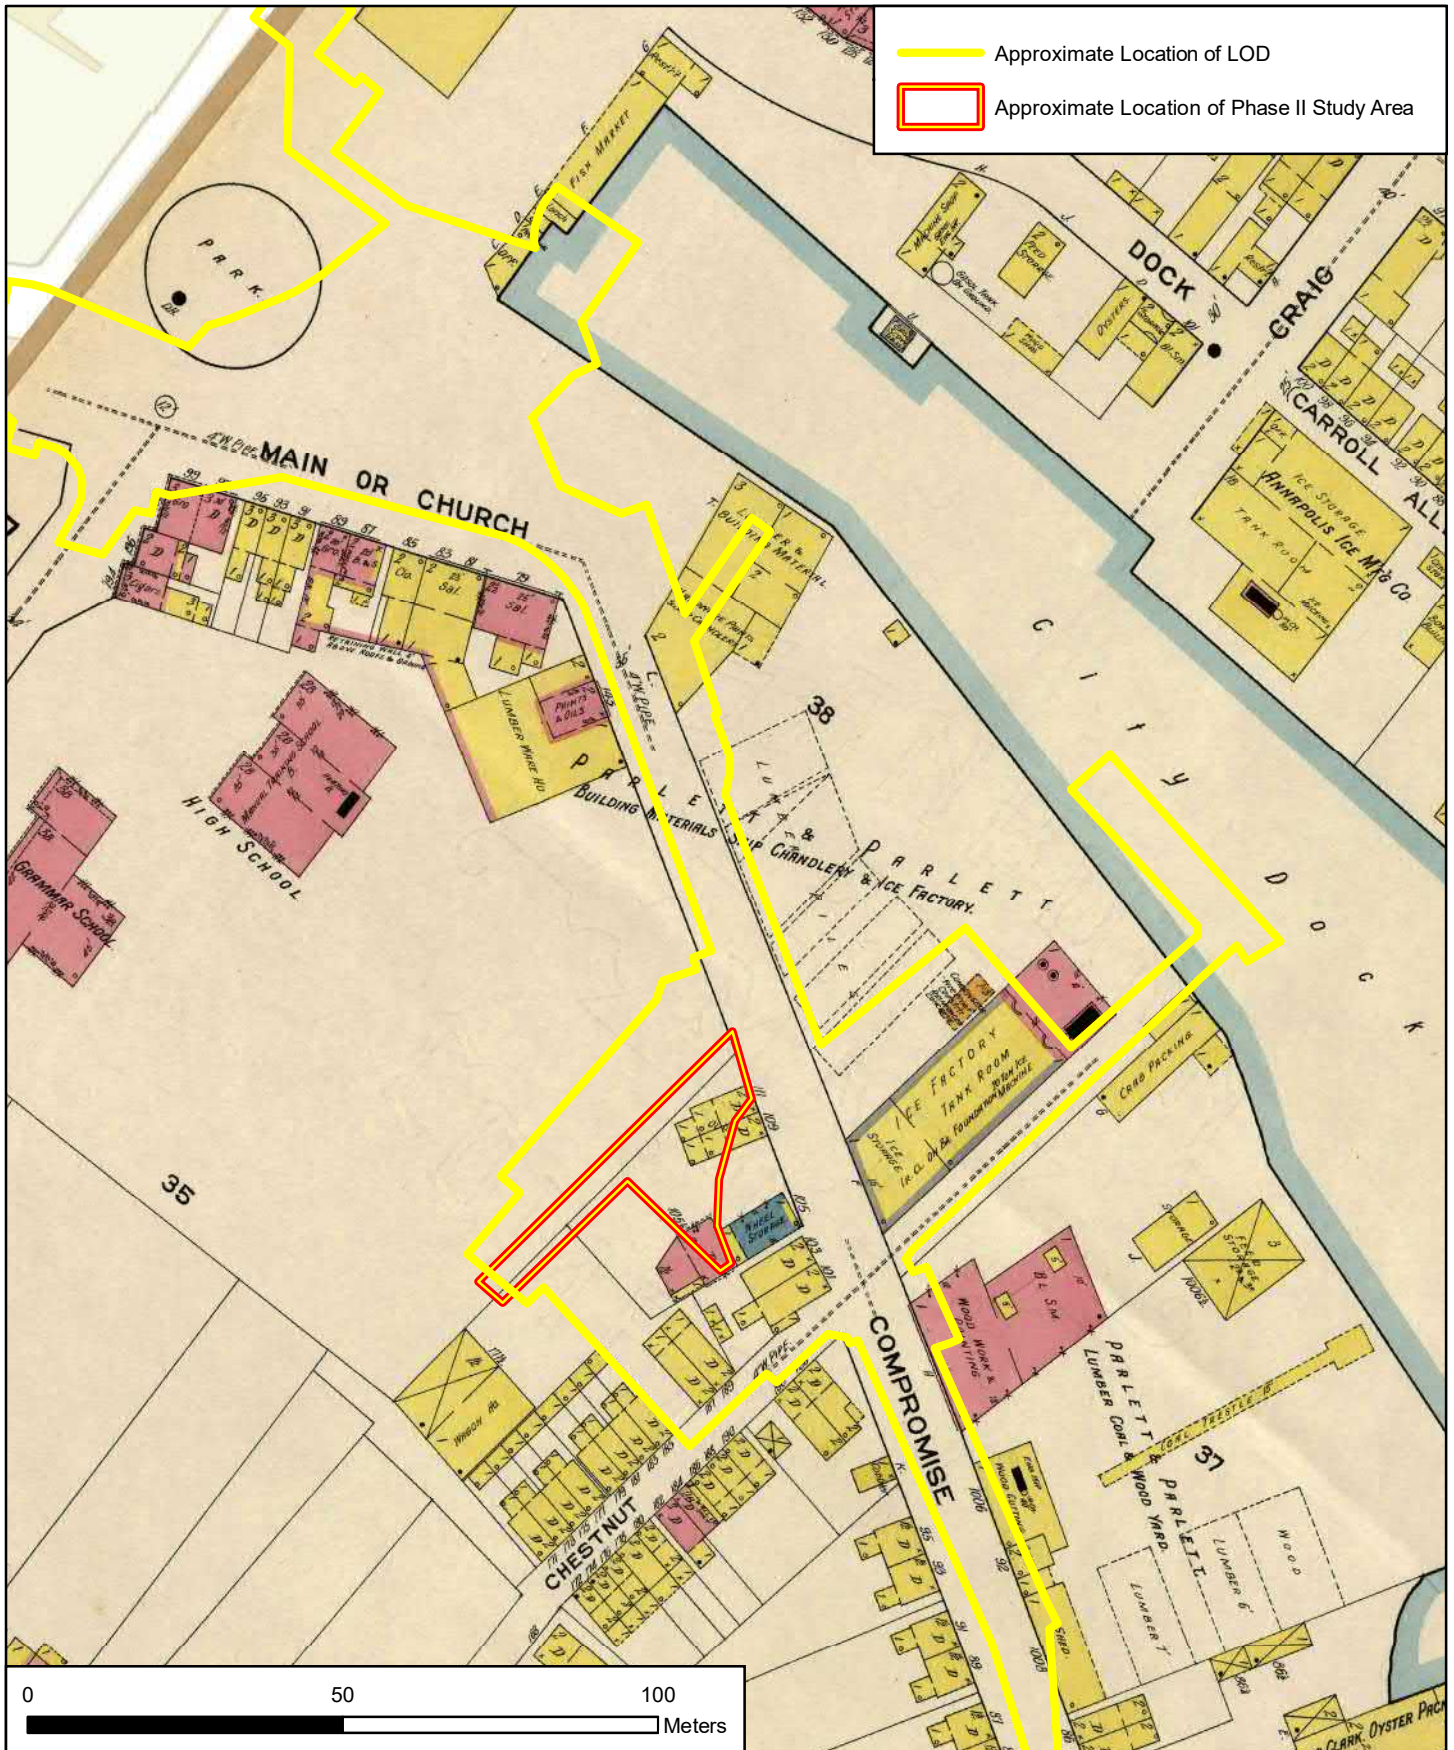

When Isaac Silver and his wife, Sarah, purchased their portion of the LOD in 1907, they took out a mortgage in the amount of \$4,000 payable to the Farmers' National Bank of Annapolis (AACDB GW 54:159-161). To secure the mortgage, the Silvers conveyed the property to Isaac Hohberger, which conveyance would be nullified upon full payment of the mortgage. It does not appear that the Silvers were able to repay the loan, as they lost the property four years after acquiring it. On March 3, 1911, James M. Monroe, an attorney authorized to dispose of the Silvers' property pursuant to their mortgage default, sold it to Isaac Hohberger and Raymond L. Moss (AACDB GW 85:119-120). The property boundaries were identical with those included in the 1907 deed, though some of the built improvements were described. In particular, the deed noted "two dwelling houses on Chestnut Street; one house and store at the corner of Chestnut and Compromise Streets; two dwelling houses on Compromise Street and one large concrete building and a large stable" (AACDB GW 85:120). On the 1908 Sanborn, these correspond to Nos. 187 and 189 Chestnut Street, Nos. 101, 103, and 105 Compromise Street, and presumably the large, one-and-a-half story stable at the rear of Nos. 171 through 177 Chestnut Street (not within the LOD). Interestingly, the property boundaries as given in the 1907 deed include Nos. 171 through 185 Chestnut Street, but they appear to have been intentionally omitted from the 1911 deed for unknown reasons.

In 1913, an updated Sanborn map was issued (Figure 3-10), showing no structural changes within the LOD. The only appreciable differences are functional, as the former grocery at No. 101 Compromise Street reverted to a dwelling, while the former pool room at No. 105 Compromise Street was used for wheel storage by 1913. The only structural change to the broader property occurred at its southwest end, where a single-story frame wagon house was constructed alongside the stables at the rear of Nos. 171 through 177 Chestnut Street.

In 1914, Raymond L. Moss conveyed to Isaac Hohberger his interest in the property the two had purchased in 1911 (AACDB GW 109:231-233), while Kate Smith sold off her property at No. 111 Compromise Street in the northeast corner of the LOD (AACDB GW 100:246-247). On March 17, 1914, she conveyed this parcel to Harry and Tilley Ivrey for \$800. No improvements were noted at the property was simply described as having approximately 24 feet of frontage along Compromise Street with 75 feet overall depth.

What was originally No. 2 Compromise Street, the property adjoining Kate Smith's and occupying part of the northeast corner of the LOD, was sold in 1920. In a deed dated September 17, 1920, Charles W.H. and Arabella W. Smith sold No. 109 Compromise Street in the northeast corner of the LOD to Louis and Lena Kotzin for \$1,500 (AACDB WNW 26:415). Charles Smith had acquired the property by this time via direct descent from his mother, Emma Smith, to whom the property was bequeathed as noted above in William Smith's will.

The 1920 Census was reviewed in an effort to determine who dwelled at Nos. 105, 109, and 111 Compromise Street (Ancestry.com 2019k). Again, these properties included dwellings whose footprints extended into that portion of the LOD that could be archaeologically investigated. In 1920, the enumerator perhaps inadvertently recorded Compromise Street as an extension of Main Street, but reference to Compromise Street will be maintained here. The enumerator did not

	FIGURE	3-10

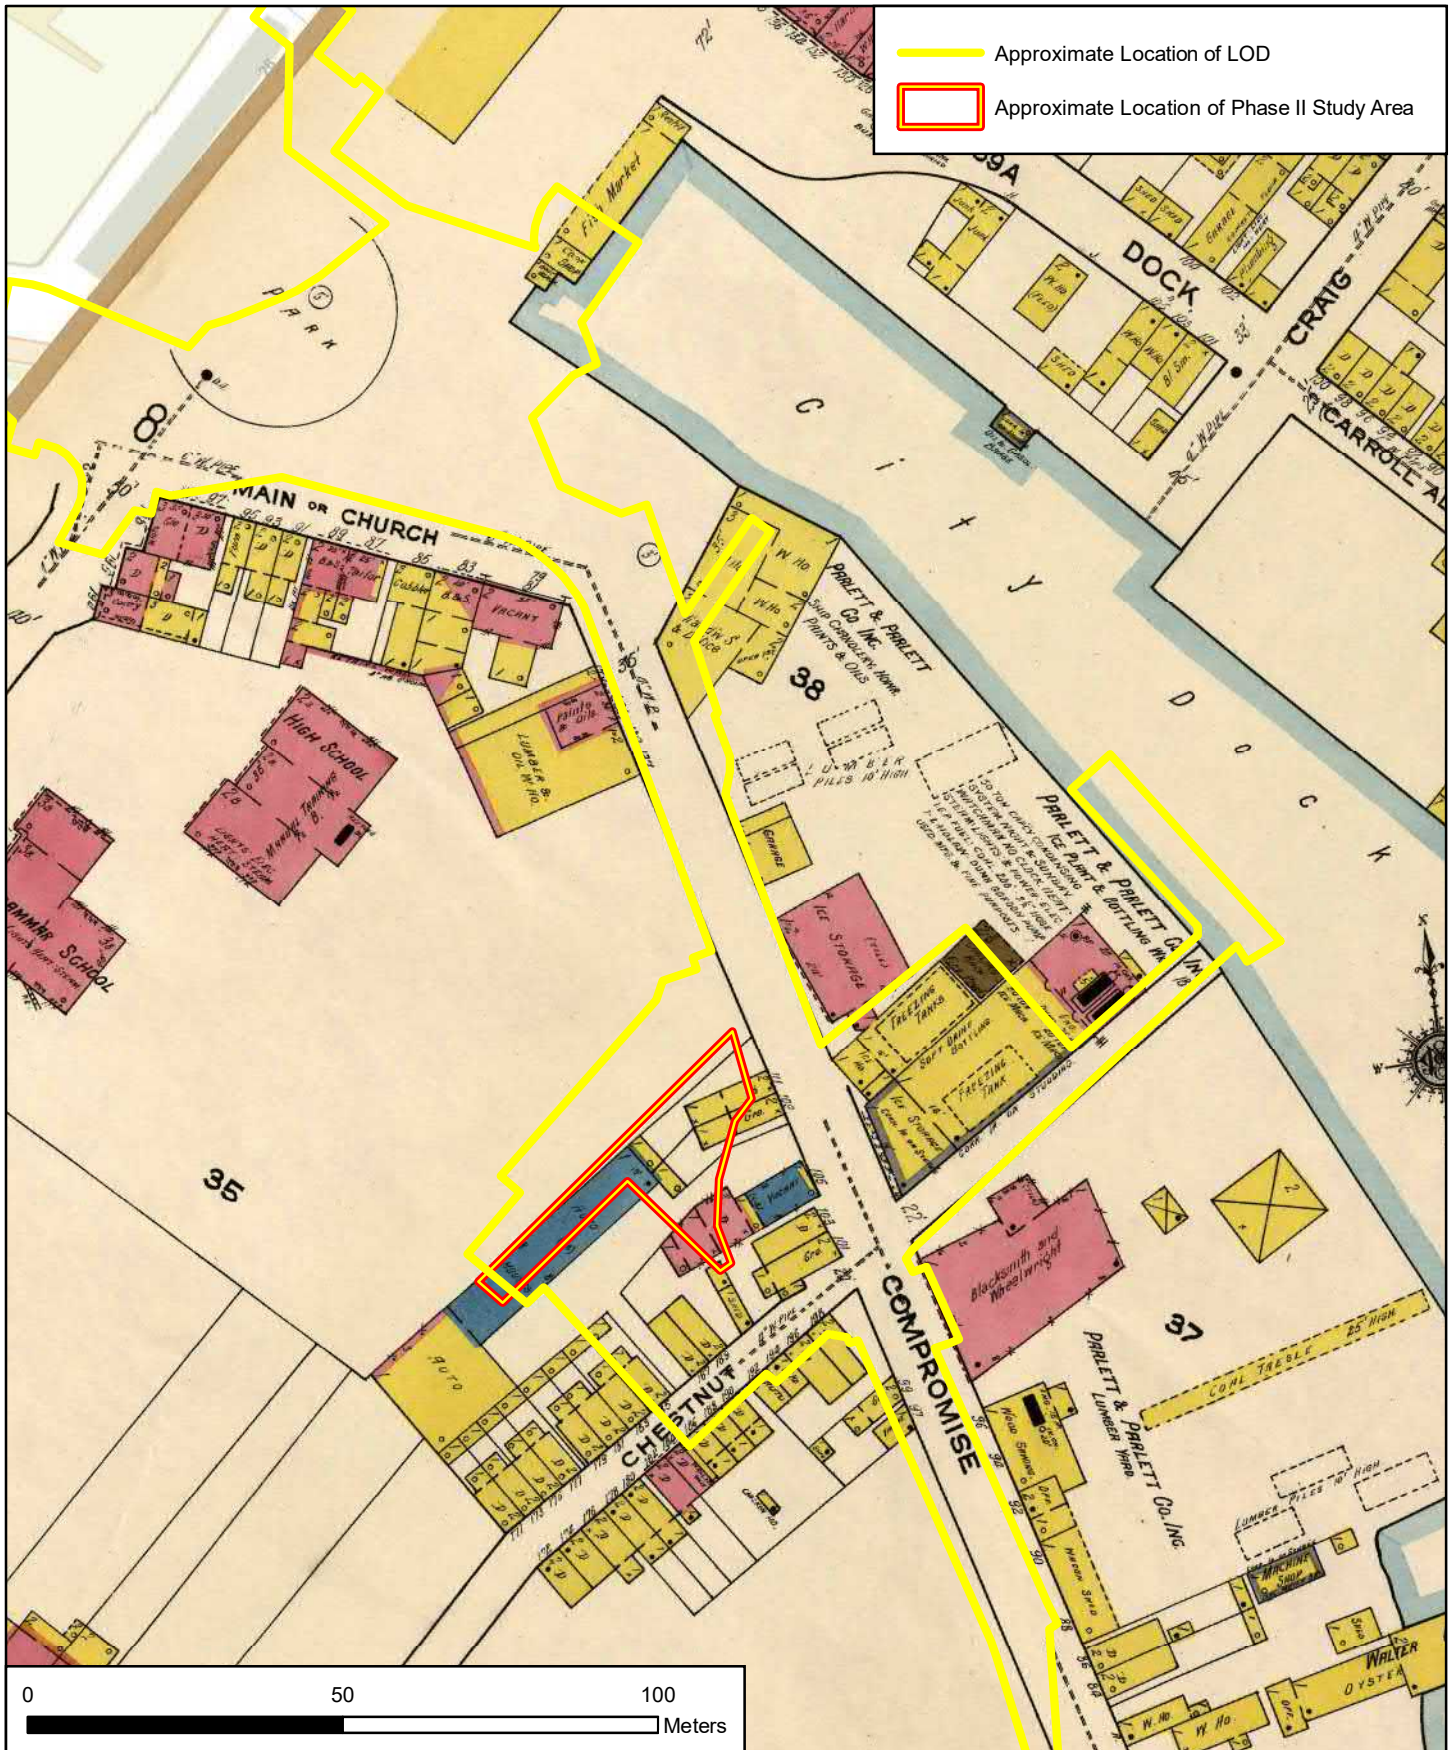

include any records for No. 105 Compromise Street, which Isaac Hohberger owned at the time. The Kotzins occupied No. 109, which they purchased in September 1920. Louis (age 43) and Lena (39) were Russian Jewish immigrants, while their son Hesse (11) and daughters Etah (8) and Zelda (1) were all born in Maryland. Louis worked as a salesman in the wholesale grocery business. At No. 111, owned by Harry Ivrey, was the Stargin family. Monen Stargin (age 41) was the head of a household that included his wife, Edna (29), their daughters Mary (15), Gladys (14), Argray (5), and Dorothy (under 1), and their sons Morsen (11) and Folton (8). Monen was a wage-earning farmer.

The 1921 Sanborn map represents the most recent, detailed map of the LOD that was available for review (Figure 3-11). It should be noted, though, that the nature of the 1921 Sanborn map made it difficult to reference to either modern maps or previous Sanborn maps and thus the depiction of the LOD on this map is considered much more approximate than previous Sanborn maps. Most of the building stock shown on the 1913 Sanborn map was still extant, though two small, single-story frame additions/outbuildings at the rear of Nos. 101 and 103 Compromise Street were replaced with a larger addition. At the rear of Nos. 109 and 111 Compromise Street, each lot now featured a small, single-story frame building possibly representing sheds or outhouses. The most substantial change was the construction of a single-story concrete block building housing several garages (“auto houses”).

When Harry and Tilly Ivrey acquired No. 111 Compromise Street in 1914, it signaled the beginning of a trend that would result in the Ivreys owning the entirety of the Phase II Study Area. On June 24, 1921, the Ivreys acquired Nos. 101 and 103 Compromise Street from Isaac Hohberger for \$4,000 (AACDB WNW 42:404-405). These represent a dwelling and grocery store as indicated on the 1921 Sanborn map, and it appears likely that Harry Ivrey operated the grocery at No. 101; a stipulation in this deed restricted Hohberger from selling or renting any of his other Chestnut/Compromise street properties to anyone who would use it for the same commercial purposes as Harry intended, “namely: groceries, provisions, and feed” (AACDB WNW 42:404).

By 1925, the Ivreys acquired most of what was once Isaac Hohberger’s property on Compromise and Chestnut streets. Hohberger died intestate, leaving his wife, Pauline, and several others as parties with an interest in his estate. His real property included three separate parcels, including two on Compromise and Chestnut streets, but only one of which encompassed part of the LOD. That parcel included the frame dwellings at Nos. 187 and 189 Chestnut Street along with “a frame store, two brick dwellings, and several garages in the rear” of a property along Compromise Street (AACDB WNW 56:461); this would represent the buildings shown as No. 105 Compromise Street and the large “auto houses” building on the 1921 Sanborn map. J. Edward Abbot acquired this property from the Hohberger estate on November 11, 1922 and sold it to Harry and Tillie Ivrey on May 1, 1925 (AACDB WNW 110 & WMB 11:432-435).

Two years later, the Ivreys acquired the property that Louis and Lena Kotzin purchased in the northeast corner of the LOD in the aforementioned 1920 deed from Charles and Arabella Smith. By this time, the Kotzins were in default on two mortgages and attorney Nicholas Green was authorized to sell their real estate to settle their debts. In a deed dated October 13, 1927, Harry Ivrey purchased the property from Nicholas Green for \$2,215 after being the highest bidder at public sale (AACDB FSR 24:12-13). The property was described as containing an unidentified building adjoining another building on a separate lot (i.e., the building located at what was originally No. 3 Compromise Street and which the Ivreys acquired from Kate Smith in 1914).

Thus, by 1927, the Ivreys owned the entirety of the Phase II Study Area, reuniting it under a single property owner for the first time since Daniel Hyde acquired it in the early nineteenth century. The 1930 Census only includes records for Nos. 105 and 109 Compromise Street, both of which would have been owned by Harry and Tillie Ivrey (Ancestry.com 2019l).

At No. 105 lived 30-year-old Filipino immigrant Victorino Pabellon along with his 22-year-old wife Anna, who was born in Maryland. Victorino served as a sailor in the U.S. Navy. At No. 109 lived 28-year-old Filipino immigrant Cayetano Lomboy along with his 30-year-old wife Ruth, who was born in Maryland. Like Victorino, Cayetano was also a sailor in the U.S. Navy. The demographic trend in these two households is visible elsewhere in the neighborhood, with several residences comprised of U.S. Navy sailors of Filipino descent and their American wives and children.

The 1940 Census included records for all three households and represents the most recent census records available (Ancestry.com 2019m). Harry and Tillie Ivrey still owned each property at the time and rented them out to a variety of people. No. 105 Compromise Street included two residential units, one of which was solely occupied by 42-year-old restaurant cook Thomas Johnson; the other included 38-year-old Work Projects Administration laborer Cecil Billilps (?), his wife, 42-year-old oyster shucker Magie, and a 39-year-old laborer named Garland James who lodged with the Billilps. At No. 109 Compromise Street, 38-year-old Filipino immigrant Mauricio Ramos, who was a cook in the U.S. Navy, was head of a household that included his 23-year-old Dominican wife Nona and his 7-year-old Dominican nephew Arturo Fernandez. No. 111 Compromise Street was occupied by the relatively large family of Dominador Castro. Dominador, a 32-year-old Filipino immigrant, served as a waiter at the U.S. Naval Academy and was the sole provider for a household that included his wife, Helen (age 25), their daughters Anna (13), Dinna (9), Doris (6), and Annita (4), and their son Dominador, Jr. (10).

The Ivreys retained ownership of the LOD until they sold it, along with the remainder of their Compromise and Chestnut streets properties, to the Housing Authority of the City of Annapolis for an unspecified sum in 1943 (AADCB JHH 298:140-141). On August 11, 1943, the Housing Authority transferred the property to its current owner, the Mayor, Counselor, and Alderman of the City of Annapolis (AACDB 312:265-266). No detailed maps or aerial photographs are available for the period immediately following the city's acquisition of the property. The earliest aerial photograph available was taken in 1951 and shows that all of the historic building stock had been demolished by this time (Figure 3-12). Currently, the 0.656-ac property serves as a city park and is identified by account number 90005006 according to Maryland's State Department of Assessments and Taxation.

4.0 PREVIOUS INVESTIGATIONS

Research on previous investigations was conducted by AECOM during the Phase IA stage of this undertaking, in early 2018. The results of that research are presented in the Phase IA assessment documentation (Furgerson et al. 2018). Supplemental geophysical research of the project area was completed by AECOM in 2019 and is summarized in the report of investigations (Seibel et al. 2019). The below addresses only investigations that have occurred within or immediately adjacent to the current LOD associated with the proposed wet well and control building. Other investigations conducted in the vicinity are addressed in the Phase IA report (Furgerson et al. 2019).

The Archaeology in Annapolis Consortium conducted excavations within the playground portion of the city park at the corner of Newman and Compromise Streets in 1984 (Archaeology in Annapolis 1984). The project included the excavation of eight 5-x-5-ft TUs in a playground area southwest of the basketball court, which documented 18AP39. The report specifically noted that the area underneath the basketball court is built on fill and likely contains undisturbed archaeological deposits underneath and that the front of the park adjacent to Compromise Street would have corresponded to the eighteenth and early nineteenth century waterfront and thus have the potential to contain wharves and related structures (Archaeology in Annapolis 1984:25).

Site 18AP39, the Newman Street site, is partially located within the LOD and spans the entire city park at Compromise and Newman Streets, though no previous archaeological investigations occurred within the current LOD. The site is the location of an eighteenth century wharf and tannery, although eighteenth century levels were not reached in the 1984 testing due to deep fill and a high water table. Testing suggested, however, that intact soil horizons remained below the fill, and the site is considered potentially eligible for listing in the National Register of Historic Places (NRHP) (Archaeology in Annapolis Consortium 1984). Per the site file, excavations in the western quadrant of the site revealed up to 5 ft (1.5 m) of nineteenth and twentieth century fill, which covered an earlier historic landscape.

AECOM's Phase IA investigation found that, despite the extensive development in the project area, there generally remains a high potential for significant historic archaeological resources related to development and use of the historic waterfront (Furgerson et al. 2019). Historic mapping showed the potential for the remains of numerous buildings and structures, as well as associated artifacts and features, is high within the majority of the proposed LOD. This is supported by archaeological investigations that have occurred within or in the immediate vicinity of the proposed LOD, most specifically the 1984 investigation at site 18AP39 by Archaeology in Annapolis and 2016 archaeological monitoring conducted by Kerns to the north. Conversely, there is low potential for prehistoric archaeological resources due to extensive infilling for the creation of City Dock.

AECOM conducted a geophysical survey and geotechnical assessment of the LOD for the proposed pump station west of the intersection of Newman Street and Compromise Street in April 2019 (Seibel et al. 2019). The geophysical survey and analysis of geotechnical soil borings further supported the assessment that the location of the wet well and control station has a high potential to contain archaeological resources dating from the early founding of Annapolis in the mid-seventeenth century up to the mid-twentieth century. The report notes that the nature of the potential resources is diverse and could include scuttled wooden ships, wharves, docks, piers, bulkheads, a tannery, warehouses, domestic residences, and commercial enterprises. Some of these

resources may be deeply buried beneath historic fill, while others may be sandwiched between layers of historic and twentieth century fill. Deeply buried resources are likely to be located below the water table, increasing the chance that organic materials will be well preserved.

5.0 RESEARCH DESIGN

5.1 RESEARCH DESIGN AND EXPECTED RESULTS

The Phase II evaluation was designed to help refine information regarding the horizontal and vertical limits of archaeological deposits within the LOD; determine the level of integrity of the archaeological deposits; conduct additional research sufficient to contextualize the archaeological deposits locally and regionally; determine the NRHP eligibility of the site and if significant archaeological deposits are located within the LOD; and determine if the project will result in an adverse effect to archaeological deposits that contribute to the NRHP eligibility of the site.

Based on previous research and archaeological and geophysical investigations at the site, it was expected that the Phase II evaluation would encounter historic features associated with eighteenth, nineteenth, and first half of the twentieth century occupation within the LOD. Deep fill layers were expected, particularly in the eastern half of the project area, where the landform had been filled in during the early nineteenth century and been built up over the course of the nineteenth through mid-twentieth centuries. Additional contextual research was expected to reveal more information about the people who historically lived within the project area, including the history of property ownership and the various commercial and residential uses of the project area as well as the age and gender makeup of the residential households, their professions and education, and ethnic backgrounds. It was further expected that features and artifacts would shed light on spatial patterning and land use as well as the veracity of historic mapping; the methods used to construct and maintain buildings and structures; and residential lifeways, including consumer patterns, socio-economic status, and possibly even ethnic traditions.

5.2 RESEARCH METHODS

Background research was undertaken using resources available from the MHT library and Maryland's cultural resource information system (MEDUSA) to characterize archaeological and above-ground resources within the vicinity of the project area. Digital archives, site forms, survey reports, and GIS data were examined to provide a depiction of the local archaeological record as part of this project's broader contextual framework. To develop a site-specific historic context, a wide variety of research materials was examined, including historic maps, aerial photography, secondary publications, and archival documents (e.g., deeds, wills, tax records, census data, and periodicals). In addition to several digital records databases, repositories visited during the course of this research include the Maryland State Archives in Annapolis, Maryland.

5.3 FIELD METHODS

The Phase II investigation consisted of formal Test Unit (TU) excavation. Each TU was 1-x-1-m or combination of two adjacent 1-x-1m excavations. TUs were excavated in 10-centimeter (cm) levels within natural or cultural stratigraphy, unless strata were noted to be modern, in which case the entire stratum was removed as a single level. Units were excavated until large architectural features were exposed and could be documented in plan. No features were excavated as a part of this investigation.

TU locations were selected based on the locations of subsurface anomalies recorded during the geophysical survey (Seibel et al. 2019) and historic mapping (cf. Furgerson et al. 2018), as mitigated by current surface conditions. No units were placed in paved areas or in high traffic areas used for recess by children from the adjacent school.

Field data were recorded on standard field forms and in general field notes. The forms included Munsell soil color, soil texture, profiles, features present, artifacts recovered, excavator's initials, and the date of excavation. The locations of TUs were noted on field maps and recorded using a global positioning system (GPS) unit. One wall of each TU was photographed and drawn in profile. In units with more complex stratigraphy, two walls were recorded.

Cultural features were identified, photographed, and mapped in plan. After documentation, plastic sheeting laid over the features for ease of subsequent identification, and the TUs were then backfilled. Feature forms describing the features' shapes and dimensions, location, and interpretation/feature types were also recorded.

All soils were screened through 6.34-millimeter (mm) (0.25-inch [in]) hardware mesh to ensure uniform artifact recovery. Collected artifacts were bagged in plastic sealing bags labeled with all relevant provenience information, including project name, TU or feature number, stratum, level, the number of artifacts recovered, excavator initials, and date. Obviously modern artifacts (e.g., plastic) were generally noted on forms and discarded in the field. Brick, mortar, building stone, and oyster shell pavements were noted and weighed and counted when possible, then discarded in the field.

While it was initially proposed to count and weigh bulk oyster shell with in-field discard, the oyster shell encountered was highly fragmented and integrated within the soil matrix, rendering such an approach unfeasible.

5.4 LABORATORY ANALYSIS

Artifacts were transported to the AECOM archaeological laboratory in Gaithersburg, Maryland, where they were cleaned, cataloged, and analyzed according to the Secretary of the Interior's *Standards and Guidelines for Curation* (United States Department of the Interior 1991) and the MHT's (2005) *Standards and Guidelines for Archaeological Investigations in Maryland – Collections and Conservation Standards, Technical Update No. 1*. The objectives of laboratory analysis and cataloging were to determine the date, function, cultural affiliation, and preliminary significance of the artifacts to the extent possible. Artifacts will be sent to the Maryland Archaeological Conservation Laboratory (MAC Lab) for permanent curation.

As appropriate, artifacts were gently washed using tap water and a soft toothbrush before being analyzed, cataloged, and rebagged according to provenience. Artifact data were entered into a Microsoft Access 2010 database. The same attributes were recorded for all artifacts, including lot number (corresponding to provenience), artifact number (sequential numbers arbitrarily assigned within a lot), count, material (i.e., the main material composition of the artifact), and form (i.e., intended use). The original form was often difficult to determine given the fragmentary nature of the artifacts, resulting in the form designation of "fragment". Additional group-specific attributes were recorded as appropriate.

5.4.1 Historic Artifacts

Many of the historic artifacts were identifiable as to material, form, and function, while others required research to determine their function and/or dates of manufacture. Numerous internet resources were helpful such as the Historic Bottle website (Lindsey 2018), the Digital Archaeological Archive of Comparative Slavery (Thomas Jefferson Foundation 2019), Florida Museum's Historical Archaeology Type Collection (University of Florida 2019), Diagnostic Artifacts in Maryland (Maryland Archaeological Conservation Lab 2012). Most artifact dating and

identification were based on the following sources: Deetz (1996); FoodRavel (2019); Lindsey (2018); Miller et al. (2000); Miller (2004/2005); Noël Hume (1969); South (1977); Whiskey ID (2019); and Visser (1997).

Identical, or nearly identical, artifacts within a provenience were grouped together under the same catalog number (note: The catalog number is the bag number followed by artifact number.) For example, all the window glass fragments within a single bag number (i.e., all from the same provenience) would be given the same artifact number. Whenever possible, mendable artifacts were grouped together. An attempt was made to classify all historic ceramics according to published pottery types (e.g., whiteware, pearlware, stoneware). Those sherds not easily recognized were assigned a descriptive name based on surface treatment and paste. Diagnostic ceramic, glass, and metal artifacts were used to estimate dates for site activities.

Historic artifacts were classified using Orser's (1988) functional typology (Table 5-1), which provides a means for interpreting the function of specific historic artifact classes. Orser's typology was used as opposed to South's (1977) as it was specifically designed for post-Civil War assemblages, can be easily translated into South's typology, and as artifacts from the seventeenth through twentieth centuries were expected to be recovered. Thus, the system allows for easier classification of mid-nineteenth to twentieth century artifacts while retaining the ability to translate artifacts from earlier components into the South system for inter-site comparison. Within Orser's system, historic artifacts were analyzed according to material type and function, when possible. One additional category, 6. Miscellaneous, is included in the functional typology to better capture unidentified artifacts. Additional subcategories are added to the labor category, 5c. Household, to capture artifacts used during household work (e.g., cleaning products, etc.); and 5d. General, to capture artifacts used in multiple labor related activities but unable to be specifically assigned (e.g., coal, slag, etc.).

Table 5-1. Functional Typology (modified from Orser 1988)

Category	Subcategory	Examples
1. Foodways	a. Procurement	Ammunition, fishhooks, fishing weights
	b. Preparation	Baking pans, cooking vessels, large knives
	c. Service	Fine earthenware, flatware, tableware
	d. Storage	Coarse earthenware, stoneware, glass bottles, canning jars, bottle stoppers
	e. General foodways	Unidentified glass and ceramic containers
	f. Floral	Nut shells, seeds, fruit pits, phytoliths, pollen
	g. Faunal	Animal bones, antlers, horns, shells, teeth
2. Clothing	a. Fasteners	Buttons, eyelets, snaps, hooks, eyes
	b. Manufacture	Needles, pins, scissors, thimbles
	c. Other	Shoe leather, metal shoe shanks, clothes
3. Household/Structural	a. Architectural/construction	Nails, flat glass, spikes, mortar, bricks, slate
	b. Hardware	Hinges, tacks, nuts, bolts, staples, hooks,
	c. Furnishings/accessories	Stove parts, furniture pieces, lamp parts

Category	Subcategory	Examples
4. Personal	a. Medicinal	Medicine bottles, droppers
	b. Cosmetic	Hairbrushes, hair combs, jars
	c. Recreational	Smoking pipes, toys, musical instruments, souvenirs
	d. Monetary	Coins
	e. Decorative	Jewelry, hairpins, hatpins, spectacles
	f. Other	Pocketknives, fountain pens, pencils, ink wells
5. Labor	a. Agricultural	Barbed wire, horse shoes, harness buckles, hoes, plow blades, scythe blades
	b. Industrial	Tools
	c. Household	Household cleaning products, clothes iron
	d. General	Coal, slag, clinker
6. Miscellaneous	a. Unknown	Unidentifiable and miscellaneous artifacts

6.0 RESULTS AND INTERPRETATION

The following section addresses the results of the investigations at site 18AP39. Six TUs covering 6 square meters were excavated. A total of 3,297 artifacts were recovered and 4 features were recorded. This section is organized into four subsections. Subsection 6.1 describes conditions recorded within each test unit, including summaries of soil profiles, artifacts and features and preservation conditions. Soils data collected during earlier geophysical survey is synthesized and presented alongside for comparison. Subsection 6.2 is an analysis and discussion of features. Subsection 6.3 is a discussion of artifacts, and Subsection 6.4 presents a synthesis of all data and interpretation of the site.

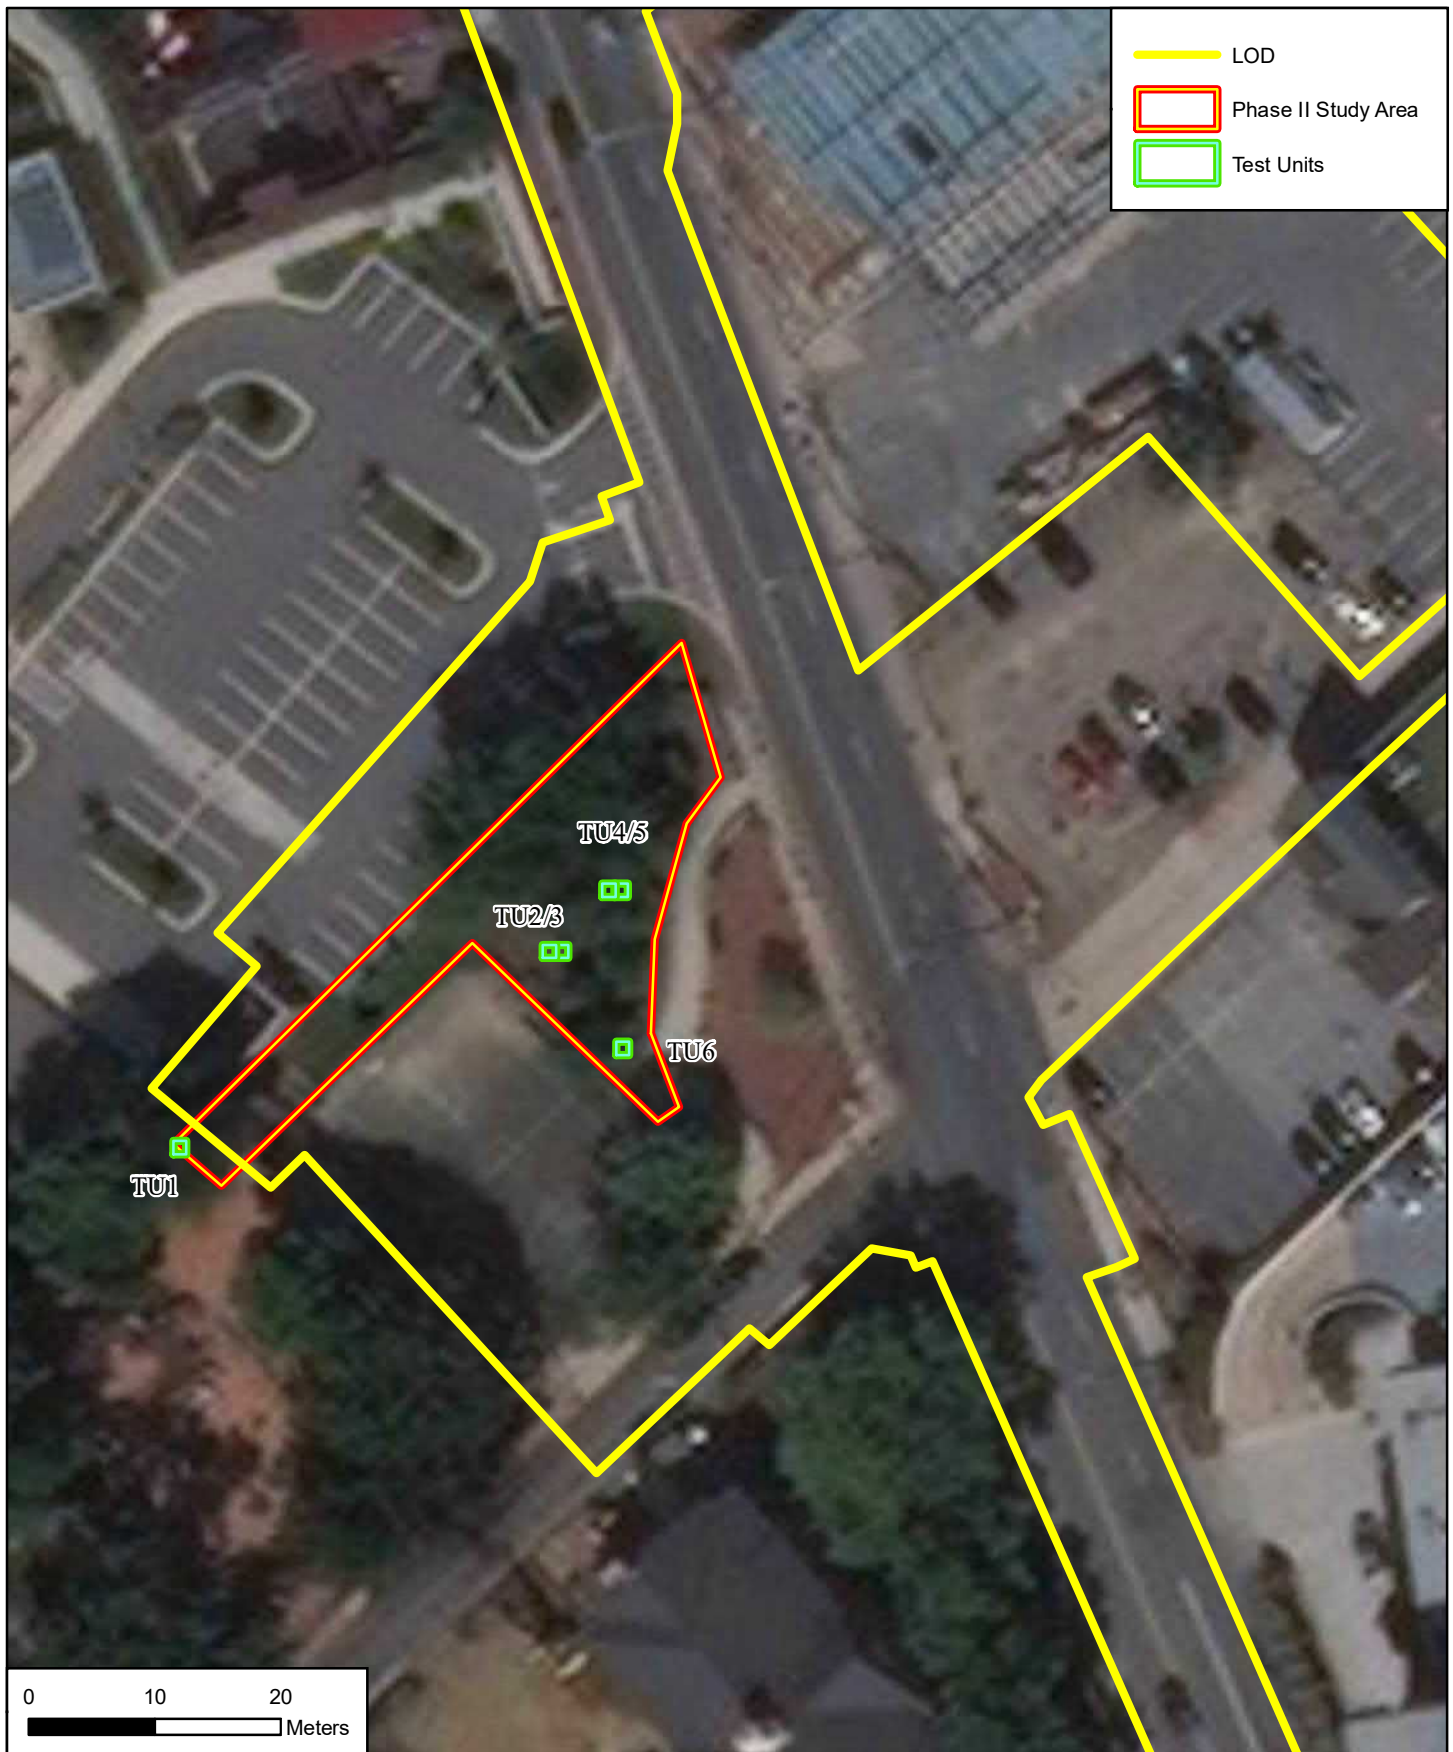

6.1 TEST UNITS

Six TUs were excavated in the project area. TUs 1 and 6 were 1-x-1 m excavations, while TUs 2/3 and 3/4 were each 1-x-2 m excavations. TU locations are mapped in Figure 6-1. Unit locations were based largely on the results of AECOM's (Seibel et al. 2019) geophysical survey of the property and the locations of historic structures as illustrated in figures in AECOM's (Furgerson et al. 2018) Phase IA assessment.

6.1.1 Test Unit 1

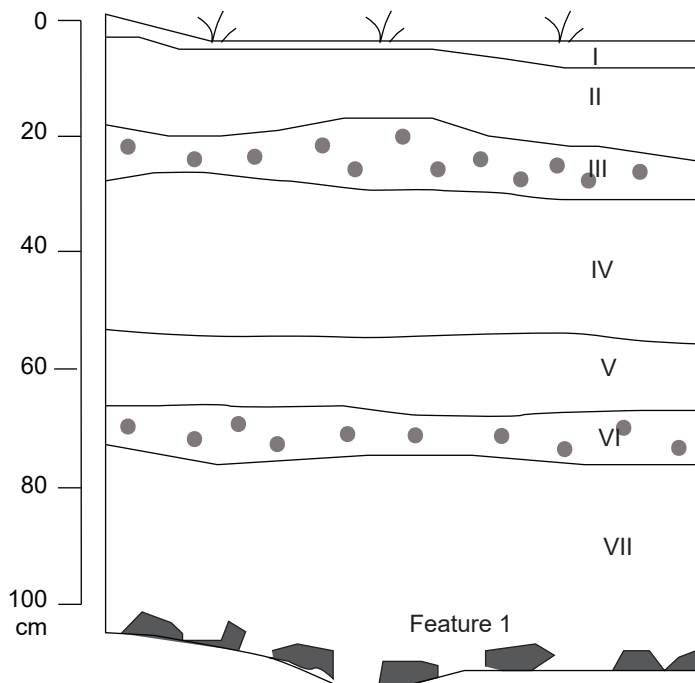

TU 1 was a 1-x-1 m excavation near the edge of a playground located in the western side of the project area. Initial plans called for placing the unit in the narrow space between the basketball courts adjacent to the playground and a retaining wall at the southern edge of the parking lot of the Annapolis Elementary School, which is located to the north of the project area. That location is slated for the placement of the electrical generator for the city's sewer pump. However, a recently built dumpster enclosure obscures a large portion of the location, and the narrow passage-space between the enclosure and the basketball courts to its south was heavily trafficked by children from the school. Placing an excavation in the area would have created a hazard. Instead, the unit was located slightly further west of the garbage dumpster enclosure, near the base of a large bois d'arc tree located at the north end of the playground (Figure 6-1). Placing the unit any closer to the enclosure was not feasible on account of the extensive root system of the tree extending across the area. The chosen location was thought to be representative of the area in general, and subsoil conditions recorded within the TU are believed to be representative of the entire Area 5 location.

TU 1 was excavated to a depth of 106 cm below ground surface (cm bgs), at which point a large feature was encountered and documented (See Subsection 6.2 of this chapter). The stratigraphic soil profile is summarized in Table 6-1 and illustrated in Figure 6-2. Strata I through VII consisted of various layers of fill and historic surfaces of progressively older age. Strata I and II represent a recently formed AO horizon over recent fill. Stratum III appears to have been an early to mid-twentieth century surface of oyster shell and compacted clay soil, which was probably used to cap a layer of fill (Stratum IV) and form a firm surface. Stratum IV was an early twentieth century layer of fill, possibly deposited rapidly and capped. Stratum V is an older fill, likely deposited around the turn of the twentieth century. Stratum VI represents a second possible historic surface of soil and oyster shell. Stratum VII is an amalgam of sandy concretions and loose granular debris, possibly representative of seafloor dredge fill that formed an organic topsoil when it was the ground surface. Diagnostic artifacts from Stratum VII mostly date from the mid to late eighteenth century (See Section 6.3 of this chapter). An eighteenth-century structural feature (Feature 1) was recorded in Stratum VII. It is discussed in greater detail in Subsection 6.2.

VII	73-106	10YR 4/4 Dark Yellowish Brown; 10YR 2/2 Very Dark Brown	Sandy Loam with Sandy Concretions	Ab formed on Fill

In total, 1,036 historic artifacts were recovered from TU 1 (Table 6-2). Artifact distribution is centered on Strata III-V, and VII. In Stratum III, artifacts are distributed relatively evenly by functional group. The formerly exposed surface may have been a generalized dumping area. The Stratum IV fill is dominated by architectural debris and may reflect a demolition episode. Strata V and VI are again well balanced in functional distribution suggesting generalized discard, possibly over a lengthy period of time as fill gradually accumulated over the shell cap surface in Stratum VI. The assemblage in Stratum VII is notably different and includes a large amount of domestic (e.g., foodways and personal) artifacts and architectural debris, likely from a demolished domestic structure also represented by Feature 1. Artifacts are discussed in further detail in Subsection 6.3.

Total	7	383	458	96	81	11	1036

6.1.2 Test Unit 2/3

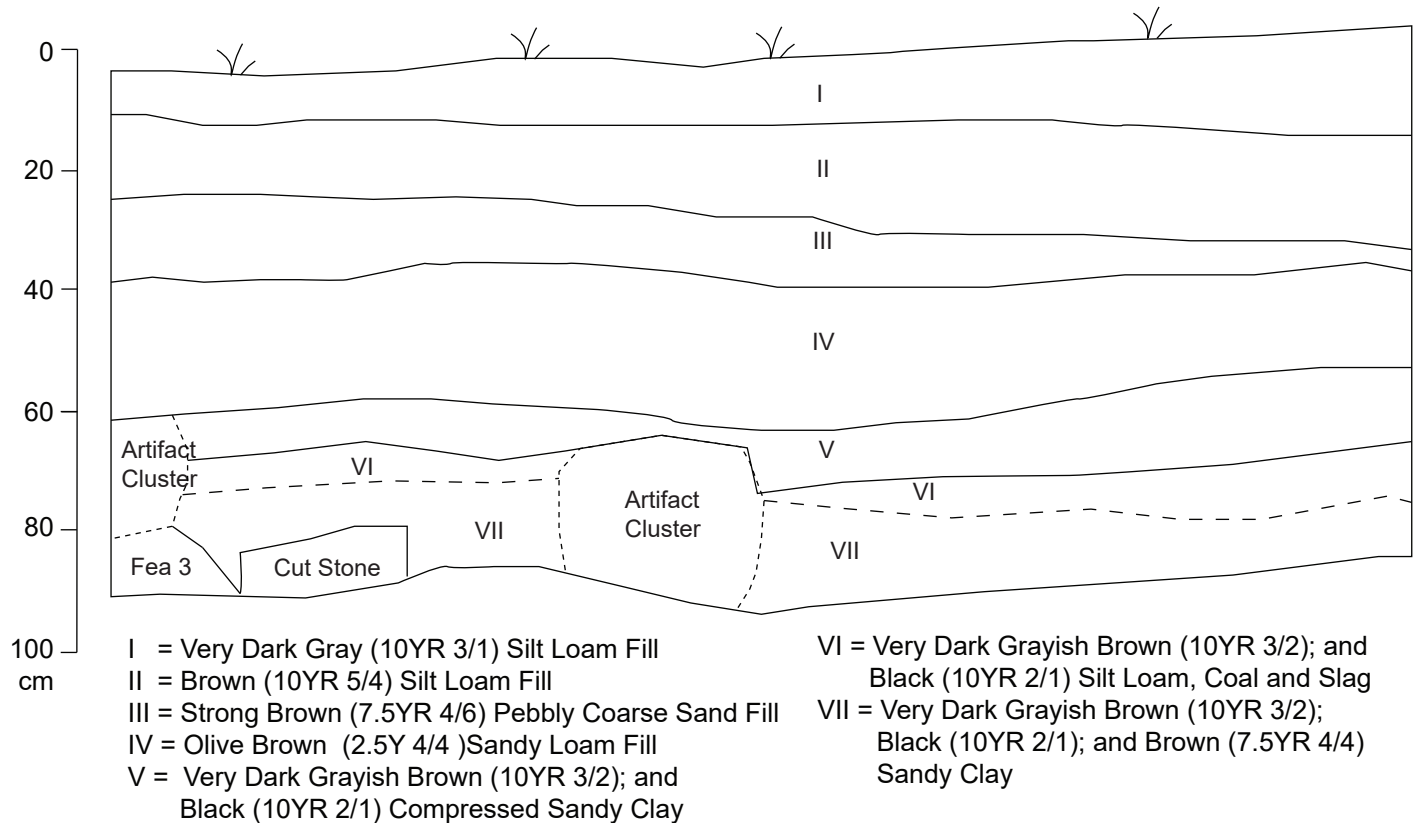

TU 2/3 was a 1-x-2 m excavation in Geophysical Survey Area 2, east of the basketball courts and north of the paved plaza area (Figure 6-1). Historic maps show structures in the approximate area dating back at least to the 1890s, and the GPR survey identified highly reflective anomalies from approximately 60 to 150 cm bgs surrounding what appeared to be a more open area, which was assumed to have been a yard (Seibel et al. 2019). The TU was excavated with its 2 m long axis oriented east to west to maximize exposure of the subsurface anomaly.

TU 2/3 was excavated to a depth of 85 cm bgs when intact features were encountered. Seven fill strata of progressively earlier deposition were recorded (Table 6-3; Figure 6-3). The first two strata were a recently deposited landscaping fill. At 33 cm bgs, landscaping fabric was encountered across the entire TU. Beneath this fabric was a thin layer of pebbly coarse sand, resembling road bedding material. Large fragments of broken asphalt were recovered from this layer further indicating a formerly paved surface. Stratum IV was a clean sandy loam fill, which contained mid-twentieth century artifacts, including a 1950s coin. Stratum V was a highly compressed layer of sandy clay, which appears to have been a soil cap deposited to seal Stratum VI. Stratum VI is a matrix of dark soil and small crushed particles of coal and slag. Stratum VI may be a demolition layer, as it contained a very high density of brick fragments, nails, window glass, and other architectural remains; diagnostic artifacts were largely from the early twentieth century. Stratum VII was a marl of several colors, with considerably less coal and slag, and many late nineteenth century domestic artifacts. Approximately 10 cm of the stratum was excavated when a series of features, including a wooden plank floor (Feature 2) and post mold (Feature 3) were exposed.

Table 6-3. TU 2/3 Soil Profile

Stratum	Depth (cm bgs)	Soil Color	Soil Texture	Horizon
I	0-12	10YR 3/1 Very Dark Gray	Silt Loam	Modern Fill
II	12-33	10YR 5/4 Brown	Silt Loam	Modern Fill
III	33-40	7.5YR 4/6 Strong Brown	Pebbly Coarse Sand	Paving Fill
IV	40-62	2.5Y 4/4 Olive Brown	Sandy Loam	Mid-20th Century Fill
V	62-66	10YR 3/2 Very Dark Grayish Brown and 10YR 2/1 Black	Sandy Clay	Compressed Clay Fill Cap
VI	66-75-	10YR 3/2 Very Dark Grayish Brown and 10YR 2/1 Black	Silt Loam, Coal and Slag Matrix	Early 20th Century Fill
VII	75-85	10YR 3/2 Very Dark Grayish Brown, 10YR 2/1 Black, 7.5YR 4/4 Brown	Silt Loam, Sandy Clay	Late 19 th -Early 20 th Century Fill

In total, 1,892 artifacts were recovered from TU 2/3 (Table 6-4). Household/Structural artifacts were the most common, followed by foodways artifacts. Few artifacts were recovered from the uppermost strata, and nearly all of those were from the late twentieth century. Artifact density and age increased once excavations cleared the fill layer in Stratum III. The highest densities were found in Stratum VI and VII. These strata included very large numbers of architectural debris and likely represent two layers of demolition fill. The architectural features at the base of Stratum VI demonstrate that at least one of structure was demolished in place. Both strata also contain large numbers of foodways artifacts. In Stratum VI, these are mostly vessel glass and may indicate a storage function for the structure. Foodways from Stratum VII include service ceramics along with ceramic and glass storage vessels. Coupled with the large number of personal artifacts, the Stratum VII assemblage indicates a domestic context.

6.1.3 Test Unit 4/5

TU 4/5 was a 1-x-2 m excavation in the northeastern end Geophysical Survey Area 2, located near the stone retaining wall separating Areas 2 and 4 (Figure 6-1). Historic maps show buildings in the area dating back at least to the 1870s, and the GPR survey identified highly reflective anomalies from 60 to 150 cm bgs (Seibel et al. 2019).

Two strata of landscaping soil were removed, at which point landscaping cloth was encountered (Table 6-5; Figure 6-4). A gravelly fill was noted below the fabric, and excavations were continued only in the western half to determine its depth. At 75 cm bgs, the gravel surpassed soil in the matrix, and water began to come up in the excavation. The soil profile is summarized in Table 6-3 and Figure 6-4.

Table 6-5. TU 4/5 Soil Profile

Stratum	Depth (cm bgs)	Soil Color	Soil Texture	Horizon
I	0-9	10YR 2/2 Very Dark Brown	Silt Loam	Modern Fill
II	9-54	10YR 2/2 Very Dark Brown; 10YR 4/4 Dark Yellowish Brown	Silt Loam; Sandy Loam	Modern Fill
III	54-75	2.5Y 4/4 Olive Brown	Silt Loam and Gravel	Modern Fill

The subsurface disturbances identified at this location may be associated with drainage features for a rain garden installed here around 2007. The gravel is not believed to be part of a buried utility line. The utility marking service that inspected the project area prior to excavations did not detect any utility lines in the TU 4/5 location.

No artifacts were recovered from TU 4/5.

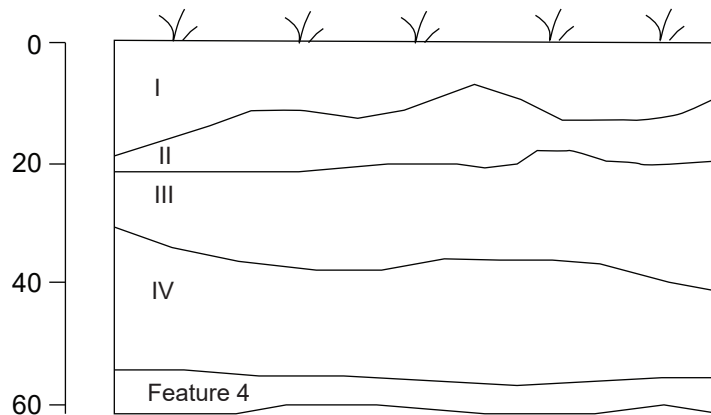

6.1.4 Test Unit 6

TU 6 was a 1-x-1 m excavation at the southern end of Geophysical Survey Area 2. The unit was near the paved plaza where the proposed sewer pump will be located (Figure 6-1). Historic maps show buildings at this location dating back to at least the 1870s, and the GPR survey identified highly reflective anomalies from 60 to 150 cm bgs (Seibel et al. 2019).

Four strata were recorded within TU 6 (Table 6-6; Figure 6-5). Each of the four strata appear to be twentieth century fill deposits. Excavations were terminated at approximately 55 cm bgs, when a brick wall (Feature 4) and filled foundation were encountered. Feature 4 is described in detail in Subsection 6.2.

III	27-45	10YR 4/4 Dark Yellowish Brown	Sandy Loam	Mid-20th Century Fill
IV	45-55	10YR 3/3 Dark Brown	Sandy Loam	Mid-20th Century Fill

Three-hundred and ninety-four (394) artifacts were recovered from TU 6 (Table 6-7). The bulk of these artifacts were recovered from the Stratum II fill layer, which was later determined to be recently deposited landscaping soil. Stratum III soil was not screened upon realization of its recent deposition. One-hundred and sixty-six (166) artifacts were recovered from Stratum IV, which may be associated with the interior demolition fill of a building represented by Feature 4. The distribution of artifact groups in Stratum IV is reminiscent of a domestic context.

6.2 FEATURES

Four architectural features were recorded during AECOM's investigations. Feature 1 may be part of an eighteenth-century structure or building. Features 2 and 3 are a wooden floor and related post from a late nineteenth or early twentieth century structure or building. Feature 4 is a brick wall from a late nineteenth century building. All features were fully documented in plan, covered with plastic sheeting, and reburied.

6.2.1 Feature 1

A portion of Feature 1 was exposed and recorded in TU 1 (Figure 6-6). The feature was first identified at a depth of approximately 100 cm bgs and exposed to a depth of 106 cm bgs. The feature extended across the entire eastern half of the unit and continued under its north, south, and west walls. The feature fill consisted of disassembled cut stones, smaller uncut stones and rocks, and brick fragments in a matrix of yellowish brown (10YR 5/4) clayey coarse sand, heavily mottled with very dark brown 10YR 2/2 sandy concretions (Figure 6-6). The soil matrix around the feature is similar to, but distinct from, the soil in the eastern half of the TU.

The feature appears to be part of a ruined wall within a builder's trench. The trench would have been excavated into the soil identified as Stratum VI in TU 1. It is not entirely clear if that soil surface had been a natural soil or a fill layer, but artifacts recovered from within it have been dated to the late eighteenth century. The trench fill soil was not distinguishable from the surrounding Stratum VI soil when TU 1 was being excavated; however, none of the diagnostics excavated from

	FIGURE 6-6
12420 Milestone Center Dr. Germantown, MD 20876	

that layer appears to be noticeably younger than the others, which suggests that the Feature 1 fill is approximately contemporaneous with the surrounding soil matrix.

6.2.2 Feature 2

Feature 2 is a preserved wooden floor found at 85 cm bgs in TU 2/3 (Figure 6-7). Wooden planks were recorded across most of the eastern two-thirds of the unit floor. The longer planks are oriented west of north and follow the approximate orientation of Compromise Street and the general layout of the once present buildings in the neighborhood. There are shorter planks oriented perpendicular to the longer planks. The shorter planks frame a rectangular opening in the wood floor, which measures approximately 60-x-45 cm, with the longer axis parallel to the longer planks. Several of the planks around the opening are fastened with square cut nails. There is a ferrous metal bracket northwest of the opening, to which an upright post has been fastened. This post has been severed at the level of the floor. Bricks and cut stones around the periphery of the feature may be associated with the same structure represented by Feature 2 but do not appear to be intact portions of the structure. The edge of a white ceramic object surrounded by a metal hoop or strap was recorded at the edge of TU 2/3. It is unclear if this is part of the Feature 2 structure or a later intrusive element.

There were many domestic artifacts removed from the soil layer immediately above the plank floors. A small cache of slate pencils was recorded just to the west of the feature but could not be clearly associated with it. At least one slate pencil was recovered from the opening inside Feature 2. Other artifacts recovered from the stratum immediately above Feature 2 have been dated to the turn of the twentieth century.

The location of Feature may correspond to a wooden addition of a building first seen on the 1885 Sanborn map, and later to wooden sheds on the end of a cinderblock auto garage illustrated on the 1921 Sanborn map (Figures 3-5 to 3-11). With nineteenth century square nails, and lack of cinderblock debris in the stratum, it is highly likely the feature predates the 1921 structures.

6.2.3 Feature 3

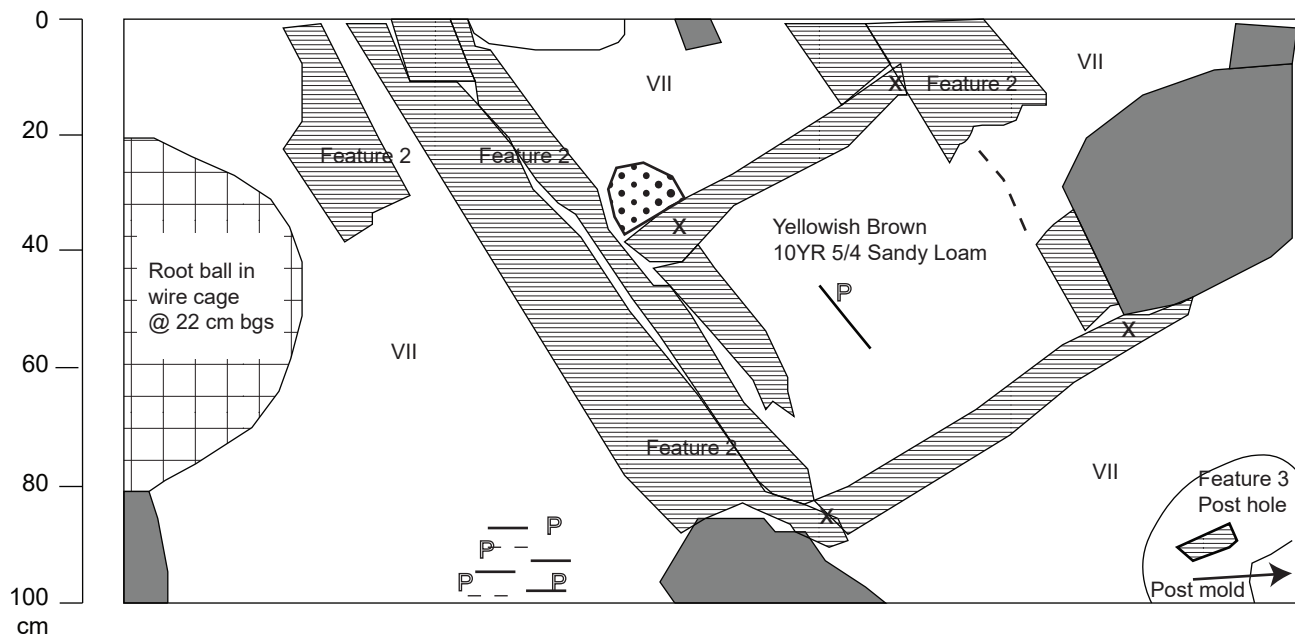

Feature 3 is located in the southeastern corner of TU 2/3, at the same depth of 85 cm bgs as the wooden floor, Feature 2 (Figure 6-7). The feature consists of a post hole and post mold both partially exposed within the unit boundaries. The feature appears to have been excavated into the soil layer that is visible at the base of TU 2/3, although it is unclear if it is related to Feature 2 or if it postdates it.

The exposed portion of the post hole has an approximate diameter of 15 cm, though it is somewhat ovoid in shape. The postmold itself is somewhat smaller, with an approximately 9 cm diameter. Fragments of wood fiber were preserved in the center of the post mold.

No artifacts were directly associated with the feature. The exposed portions of the feature were mapped in plan, and the feature was then covered and reburied.

6.2.4 Feature 4

Feature 4 is a section of brick wall exposed in TU 6 (Figure 6-8). The wall was exposed at a depth of 55 cm bgs. Its orientation parallels Compromise Street and the layout of extant and historically mapped buildings. The wall is approximately 25 cm wide and consists of two courses of bricks. In the outer course the bricks are oriented with their long axes parallel. In the inner course, the bricks are arranged end to end. The bricks are cemented with a white lime mortar.

TITLE Feature 4 Plan	
 12420 Milestone Center Dr. Germantown, MD 20876	PROJ NO 60533093
	FIGURE 6-8

A sliver of soil visible in the northeast corner of TU 6 and northeast of Feature 4 is a clean brown (10YR 4/3) silty loam that is distinct from the soil stratum immediately above where Feature 4 was exposed. This may represent a builder's trench. Soil east of Feature 4 was a matrix of very dark grayish brown (10YR 3/2) silty loam, along with brick and mortar fragments and lime dust that most likely represents the interior space of the building (possibly a cellar) filled with its own demolition debris.

Feature 4 corresponds with a brick dwelling visible on the 1885 through 1903 Sanborn maps (Figures 3-5 through 3-8). The precise location of the building shifts slightly between the maps, but it appears that all have the same orientation with a slightly canted north wall. A building illustrated slightly further south on the 1878 Hopkins map (Figure 3-4), may also be the same.

6.3 ARTIFACTS

In total, 3,297 artifacts were recovered from the site during this investigation. All artifacts are historic. The clothing (n=16), foodways (n=1,266), household/structural (n=1,411), labor (n=236), personal (n=47), and miscellaneous (n=321) groups are represented

6.3.1 Clothing Group

Sixteen clothing group artifacts were recovered (Table 6-8) and include buttons (n=11), shoe eyelets (n=4), and a leather shoe insole (n=1). The button assemblage includes flat shell buttons (n=4), a milk glass button (n=3), and both domed (n=1) and flat (n=3) brass buttons. One of the brass buttons is U.S Navy issue. It features an eagle facing right and holding an anchor. The right facing eagle was used only during the period ca. 1810-1830 (Silverstein 2019). No other diagnostic clothing items were recovered, though based on its level of preservation, the leather shoe insole probably dates from the twentieth century.

There is a patterned artifact distribution. Brass buttons were found only in TU 1, in the fill strata III and IV. Shell and glass buttons were found in the fill strata of TUs 2/3 and 6. Shoe eyelets were in Strata IV and V of TU 1 and Stratum IV of TU 2/3. The insole was in Stratum IV of TU 2/3.

Total			16	2	4	1	1	2	3	2	1

6.3.2 Foodways Group

There were 1,266 Foodways artifacts recovered from the site. The bulk of these were glass (n=872) vessel shards, followed by ceramic (n=279) sherds, faunal remains (n=104), and metal objects (n=11) including munitions, classified as foodways, considering they might have been used for hunting. Discussion of foodways artifacts is broken down by discussion of glass vessels, then ceramic vessels, faunal remains, and then "other" foodway artifacts.

6.3.2.1 Glass Vessels

Glass vessel shards are one of the most abundant artifact types in the assemblage (Table 6-9). They can be broken down into bottles (n=562), bowls (n=3), cups (n=4), jars (n=9), tableware (n=5), and unidentified shards (n=289). Of these, 258 are temporally diagnostic.

Table 6-9. Summary of Glass Foodways Artifacts

Object	Type	Date Range	TU 1						TU 2/3					TU 6	
			I/II	III	IV	V	VI	VII	II/III	IV	V	VI	VII	II	IV

	Pressed Glass	Post-1825										2			
Unidentified				22	16	4	1	9	1	42	48	65	2	40	39
Total			5	71	42	10	9	34	25	111	76	192	140	80	79

Early diagnostic shards include pre-1820 free blown bottle fragments (n=4) and an applied finish bottle fragment made between 1800 and 1885, but most likely in the 1840s (n=1). Shards from the middle to late nineteenth century are of the post and cup bottom blown in mold style bottles (n=6) and a mold blown jar (n=1). Most diagnostic glass is from the late nineteenth to twentieth century. It includes tooled finish (n=5), cap seat (n=1), milk glass (n=7), and various kinds of machined glass (n=256). Various pressed glass artifacts (n=5) and a fragment of an uranium glass cup (n=1) may date from any period after the 1820s.

Glass artifacts were ubiquitous throughout the site. However, the bulk of glass artifacts were recovered from Stratum III of TU 1 (n=71); Strata IV, VI and VII of TU 2/3 (n=111, 192, and 140, respectively); and Strata II and IV of TU 6 (n=80 and 79, respectively). Specimens most likely to predate the late nineteenth century were from TU 2/3 Stratum VII (n=6) and TU 1 Stratum III (n=1). Late nineteenth to twentieth century glass was most abundant in TU 2/3 Strata IV-VI (n=143) but was also found in lesser quantities in TU 2/3 Stratum VII (n=50) and throughout the upper six strata of TU 1 (n=21) and the upper four strata of TU 6 (n=25).

6.3.2.2 *Ceramic Vessels*

There are 242 ceramic vessel sherds in the assemblage; including food preparation (n=1), service (n=219), storage (n=19), and unidentified (n=3) types (Table-6-10). Two-hundred and twenty-six (226) of the identified sherds are temporally diagnostic. Roughly 22 percent (n=50) predate the 1820s, while the remaining 126 date from between the 1820s and the 1940s. Diagnostic sherds are summarized in Table 6-10 on the following page of this document.

Ceramic vessels are clustered in two areas, TU 1 and TU 2/3. In TU 1, more than 40 percent (n=98) of all sherds were recovered from Stratum VII. In TU 2/3, 47 percent of all sherds (n=114) were recovered from Strata VI and VII. More than 51 percent (n=35) of the diagnostic sherds (n=69) from TU 1 Stratum VII were manufactured prior to the 1820s, whereas nearly all of the diagnostic sherds in TU 2/3 Strata VI and VII are from the mid to late nineteenth or early twentieth centuries. Pre-1820s sherds also occur in the higher strata of TU 1 but occur in very low numbers.

Service wares far outnumber storage vessels in all contexts where both kinds occur. In TU 1, Stratum VI, the ratio of service to storage wares is 7 to 3. In TU 2/3, Strata VI and VII, it is 9 to 1. Only one food preparation sherd was identified, recovered from Stratum VII of TU 1.

6.3.2.3 *Other Foodways Artifacts*

The remaining foodways artifacts consist of faunal remains (n=103), munitions (n=3), and crimped bottle caps (n=8; Table 6-11). The faunal remains include only vertebrate bones. There were many tens of thousands of oyster shells that comprised part of the soil matrices of many of the strata excavated, and being so numerous and ubiquitous, they were not quantified or collected. It is unknown how many of these oyster shell fragments were in fact food remains and how many might have been included naturally occurring in the shoreline soils and borrowed soils that make up the local terrain. Identified munitions include two shotgun shells and a 6 mm bullet casing. Crimped caps are of the soda and beer bottle variety but are too corroded to identify brands.

Table 6-10. Summary of Ceramic Foodways Artifacts

Object	Type	Date Range	TU 1					TU 2/3					TU 6

Table 6-11. Summary of Other Foodways Artifacts

Object	Type	Date Range	TU 1					TU 2/3		TU 6	
			III	IV	V	VI	VII	VI	VII	II	IV
Faunal	Animal Bone		3	18	2		34	2	35	7	2
Munition	Shotgun Shell		1			1					
	Bullet Shell	Post 1860s					1				
Bottle Cap	Crimpled Cap							8			
Total			4	18	2	1	35	10	35	7	2

The distribution of these artifacts closely mirrors that of the ceramic and glass artifacts. The bulk of the animal bones from TU 1 were recovered from Stratum VII. In TU 2/3, mammal bones also came mostly from Stratum VII. Munitions were all found in TU 1. The bullet casing may be intrusive into Stratum VII. Large portions of the glass and ceramic diagnostics from that context date to the eighteenth and early nineteenth centuries. However, breech loading fire-arms with integrated brass cartridges did not become commonplace until the mid to late 1860s. The crimped soda or beer caps in Stratum VI of TU 2/3 would have been made after the mid-1890s, and thus match dates with most of the ceramic and glass artifacts found in the stratum.

6.3.3 Household/Structural Group

Household/Structural group artifacts were the most common type throughout the site. Bricks (n=434) were the most common and ubiquitous. Other structural ceramic objects included drain pipes and drainage tile (n=48), an agateware knob (n=1), flower pot fragments (n=11), unidentified coarse earthen tile (n=2), and electrical porcelain components (n=2). One piece of cut sandstone was collected for sampling, though several dozen more cut stones, mostly granite, were noted in the field. This was particularly true of Feature 1. Mortar and plaster (n=19) were common. Window glass (n=398) was the second most common artifact after brick.

Metal artifacts include wrought nails (n=4), cut nails (n=97), wire nails (n=138), and indeterminate nails (n=187). There are also square nails that may have been cut or wrought (n=16). Other metal hardware included screws, washers, bolts, fence staples, hinges, and wires, all of which are summarized in Table 6-12 on the following page of this document. There was also a loch mechanism, possibly from a door (n=1), and an elaborately decorated sink spigot (n=1).

Finally, a red tinted piece of machined lamp glass was recovered. The shade did not appear to be automotive in shape or size. Instead it resembled an exterior building light. Household/Structural artifacts are distributed evenly throughout the site. Bricks and window glass are especially numerous throughout much of the site. As with all other artifacts, the highest concentrations occur within TU 1, Stratum VII, and TU 2/3, Strata VI and VII.

The porcelain electrical components in TU 2/3 Stratum VII and TU 6 Stratum IV were identified as being switch insulation components made between 1901 and 1911. The agate ware knob from TU 2/3, Stratum VII dates to the nineteenth century. The lock mechanism from the same context would have been made sometime in between 1854 and 1970. Its condition suggests an early date from that range.

Table 6-12. Summary of Household/Structural Artifacts

Total			45	147	58	34	178	42	58	93	247	358	98	56

The red tinted lamp shade from TU 2/3, Stratum IV, was machine made and post-dates the early 1890s. Nails were the most ubiquitous of the diagnostic artifacts. Early hand wrought nails, which predate 1819, were found in only in TU 1, Stratum IV, TU 2/3 Stratum VII, and TU 6, Stratum II. Cut nails dating from the 1790s-1890s were more common and found in almost all strata, with the highest densities in TU 1, Stratum VII, and TU 2/3, Stratum VII. Additional square nails, which may be cut or hand wrought, were found at highest densities in TU 1, Stratum VII. Wire nails post-dating the 1890s were recovered from nearly all contexts, with the highest density occurring in TU 2/3, Stratum VII, alongside the earlier cut nails.

At least 15 of the 99 brick fragments in TU 1, Stratum VII, recovered around Feature 1 were identified as hand made. Hand made bricks differ in age at different locations, but often represent early construction in settlements where supply of mass-produced bricks was irregular. This may be representative of Annapolis prior to the merchant boom of the mid-1700s.

6.3.4 Labor Group

Labor group artifacts are numerous at the site, mostly on account of coal and slag, which were grouped into the labor categories (Table 6-13). There were 174 larger pieces of coal that were counted and discarded in the field. However, crushed coal fragments were part of the soil matrix in TU 2/3, Stratum VI, and to slightly lesser extent, Stratum VII. Other labor artifacts included slag (n=44), carbon battery cores (n=14), and barbed wire (n=1).

Table 6-13. Summary of Labor Category Artifacts

Object	Type	Date Range	TU 1					TU 2/3				TU 6	
			II/III	IV	V	VI	VII	I/II/III	IV	VI	VII	II	IV
Industrial Waste	Coal		5	10	50	3		18	9	23	55		1
	Slag		9		3		2			6	24		
Batteries	Carbon Core	Post-1870		3	2	1	6				2	2	
Barbed Wire	Barb	Post-1874					1						
Total			14	11	55	4	9	18	9	29	81	2	1

Coal fragments were present within most parts of the site, particularly in TU 2/3, strata VI and VII, and TU 1, Stratum V. Coal is notably absent from TU 1, Stratum VII. Most of the identified slag is concentrated in TU 2/3, strata VI and VII. Carbon battery cores are surprisingly common at the site, and the bulk (n=6) were recovered from TU 1, Stratum VII. The barbed wire barb was also recovered from the same early deposit in TU 1. The dry cell battery cores and barbed wire post-date the early 1870s.

6.3.5 Personal Group

Forty-five artifacts from the Personal Group were recovered from the site (Table 6-14). They include bottles of ink (n=1), medicine (n=7), cosmetic cream jars (n=3), toys (n=6), coins (n=2), keys (n=3), pencils (n=17), and clay tobacco pipes (n=6). Identified medicine bottles include an 1870-1920 Omega oil bottle, and an 1885-1945 Sloan's Liniment bottle. The toy assemblage includes the clay bust of a cloth doll made in Germany between 1890 and 1930, clay marbles, and glass marbles. The keys include an iron skeleton key, and small brass keys. The pencil assemblage includes one copper alloy machined pencil ferrule, and a cache of slate pencils.

Many of these artifacts are diagnostic of the late nineteenth to early twentieth centuries and were recovered from Stratum VII of TU 2/3, in some cases directly from or very near the surface of a buried plank floor (Feature 2). This is especially true of the slate pencils. Six kaolin pipe fragments with bore diameters placing them in the range of 1680 to 1800 were recovered from near Feature 1 in TU 1, Stratum VII.

Table 6-14. Summary of Personal Group Artifacts

Object	Type	Date Range	TU 1			TU 2/3			TU 6	
			II/III	VI	VII	IV	VI	VII	II	IV

Total			1	1	7	2	3	28	2	1

6.3.6 Miscellaneous Group

Artifacts from the Miscellaneous group consist mostly of small unidentifiable fragments of metal, glass, and plastic. These artifacts occurred at densities corresponding to artifacts from the other functional groups and are believed to represent additional fragments of similar artifacts. Miscellaneous artifacts are summarized in Table 6-15 and are not discussed any further.

Table 6-15. Summary of Miscellaneous Group Artifacts

Object	TU 1					TU 2/3				TU 6

6.4 DATING

Even though the site strata are composed primarily of fill layers, the large number of diagnostic artifacts recovered from the site allow many of these layers to be dated. However, in most cases, the diagnostic artifacts within each layer are to some extent commingled by date. Furthermore, strata with older artifacts are unexpectedly superpositioned over strata with younger artifacts. Fill soils may have been “borrowed” from elsewhere and redeposited. Artifacts and soils could have also eroded from the bluff that rises to the west of the site, and soils would have undoubtedly been impacted by the roiling effects of waves and tides, particularly in TU 1, prior to land building and the construction of Compromise Street in the early nineteenth century. Finally, younger artifacts often become comingled with older deposits through natural processes of bioturbation (e.g., animal burrowing, tree root activity). At best, an average date was attempted by measuring the median age of each type of diagnostic artifact, then measuring the relative frequency with which each median age is represented. Average age was determined by adding the start and end dates and dividing by two. This skewed the average age for artifacts with start dates in the late nineteenth century and manufacturing that extends to the present day (e.g., wire nails, machined glass). To counter some of this skewing, an end date of 1960 was selected, as by that point, plastic bottles and stainless-steel nails were becoming more commonplace.

Once the number of artifacts from each age was calculated, they were aggregated into 50-year blocks, from 1700 to 2000, and the relative frequency of artifacts (percent of total) was calculated within each 50-year block. No effort was made to date the top three strata (I-III) in TUs 1, 2/3, and 6, as these are known to be recent deposits. Particular emphasis was placed on dating TU 1, Stratum VII, TU 2/3 Stratum VII, and TU 6, Stratum IV, as this is where features were recorded. Terminus post quem (TPQ) dates are provided for each stratum in the tables below. The TPQ dates are based on ceramic or very diagnostic glass artifacts; nails and ceramic or glass artifacts with overly broad date ranges (e.g., engraved glass, ca. 1725-present; unidentified porcelain, ca. seventeenth century-present) were excluded. Due to the date ranges for various artifacts, there are instances where an artifact TPQ date is earlier than the 1700-1750 date block in which it was placed for the relative frequency calculations.

If fill episodes reflect gradual deposition, then the peak block of each stratum should be closer to the present than the peak block of the stratum below it. Overlap in artifacts from adjacent age blocks is expected, as Gaussian (bell curve) distribution is anticipated. If distribution curves are bimodal, or otherwise out of accordance with the law of superposition, then disturbance and earth borrowing can be postulated.

The results for TU 1 reveal gradual accumulation throughout the nineteenth century with disturbance or infilling beginning in the early twentieth century (Table 6-16). Stratum VII, where Feature 1 was recorded, has the highest relative frequencies of artifacts from the eighteenth century, and from the first half of the nineteenth century. Stratum VI artifacts begin with a peak at the first half of the nineteenth century and gradually decrease in the second half of the nineteenth century and into the first half of the twentieth century. Stratum V has a bimodal distribution with peaks between 1801-1850, and 1901-1950. There are also artifacts from the eighteenth century, but none from the second half of the nineteenth century. This may mean that the stratum originated in the first half of the nineteenth and was then disturbed in the first half of the twentieth, or that older soils were redeposited here from a different location. Stratum V has an unexpected Gaussian distribution with a peak in the early nineteenth century. If Stratum VI consists of redeposited or disturbed soils, then Stratum V is presumably disturbed as well.

Table 6-16. Relative Frequencies of Artifacts by Average Age in TU 1

Age	IV	V	VI	VII
1700-1750	2%	8%	0%	9%
1751-1800	3%	15%	0%	25%
1801-1850	53%	46%	42%	41%
1851-1900	27%	0%	33%	22%
1901-1950	13%	31%	25%	3%
1950+	2%	0%	0%	0%
TPQ	1683	1720	1775	1720

The results from TU 2/3 show more recent deposition. Stratum VII's earliest artifacts date to the first half of the nineteenth century, although these include primarily cut nails, whose average age skews early, but which may be from the latter half of the nineteenth century. Artifacts gradually increase and peak in the early twentieth century and decline during the second half of the twentieth century (Table 6-17). The same is true of Stratum VI, though the quantities of twentieth century artifacts is higher than in Stratum VII, while older artifacts occur less frequently. The curve in Stratum V is more irregular. It contains a higher frequency of 1801-1850 artifacts than either Stratum VI or VII. There is then a decline in 1851-1900 artifacts, followed by a rapid spike of 1901-1950 artifacts, followed by a second sharp decline. The vast majority of Stratum IV artifacts are from the 1901-1950 period, with small amounts of 1950+ period artifacts and trace amounts of 1851-1900 artifacts.

Table 6-17. Relative Frequencies of Artifacts by Average Age in TU 2/3

Age	IV	V	VI	VII
1801-1850	<1%	18%	3%	14%
1851-1900	3%	11%	23%	28%
1901-1950	85%	58%	49%	39%
1950+	12%	13%	24%	18%
TPQ	1842	1842	1805	1785

The pattern can be interpreted as gradual accumulation of materials in the late nineteenth century in Stratum VII, followed by rapid infilling and disturbance during the early twentieth century (Stratum VII), followed by soon afterwards by a second (Stratum VI) and third (Stratum V) episode of filling and disturbance. Stratum IV may have accumulated more gradually during the latter parts of the first half of the twentieth century. The non-trivial amounts of mid-twentieth century artifacts in each of the strata may indicate additional disturbances mid-century. Of note is that this scenario indicates that Features 2 and 3 might predate the peak period (i.e. 1901-1950) of the artifacts from Stratum VII but might be contemporaneous with the nineteenth century materials. Based on the history of the landform discussed in Chapter 4, the earliest possible dates for the feature might be from the 1820s or 1830s.

The results from TU 6 place Stratum IV in the first half of the twentieth century (Table 6-18). This corresponds to the buildings visible in that area on the 1913 and 1921 Sanborn maps and provide a secure period for the demolition of the building prior to the 1950s. Early nineteenth century materials commingled in the building fill may indicate its period of construction, but more data will need to be collected from Feature 4 to test this hypothesis.

Table 6-18. Relative Frequencies of Artifacts by Average Age in TU 6

Age	IV
1700-1750	0%
1751-1800	0%
1801-1850	11%
1851-1900	15%
1901-1950	67%
1950+	7%
TPQ	1825

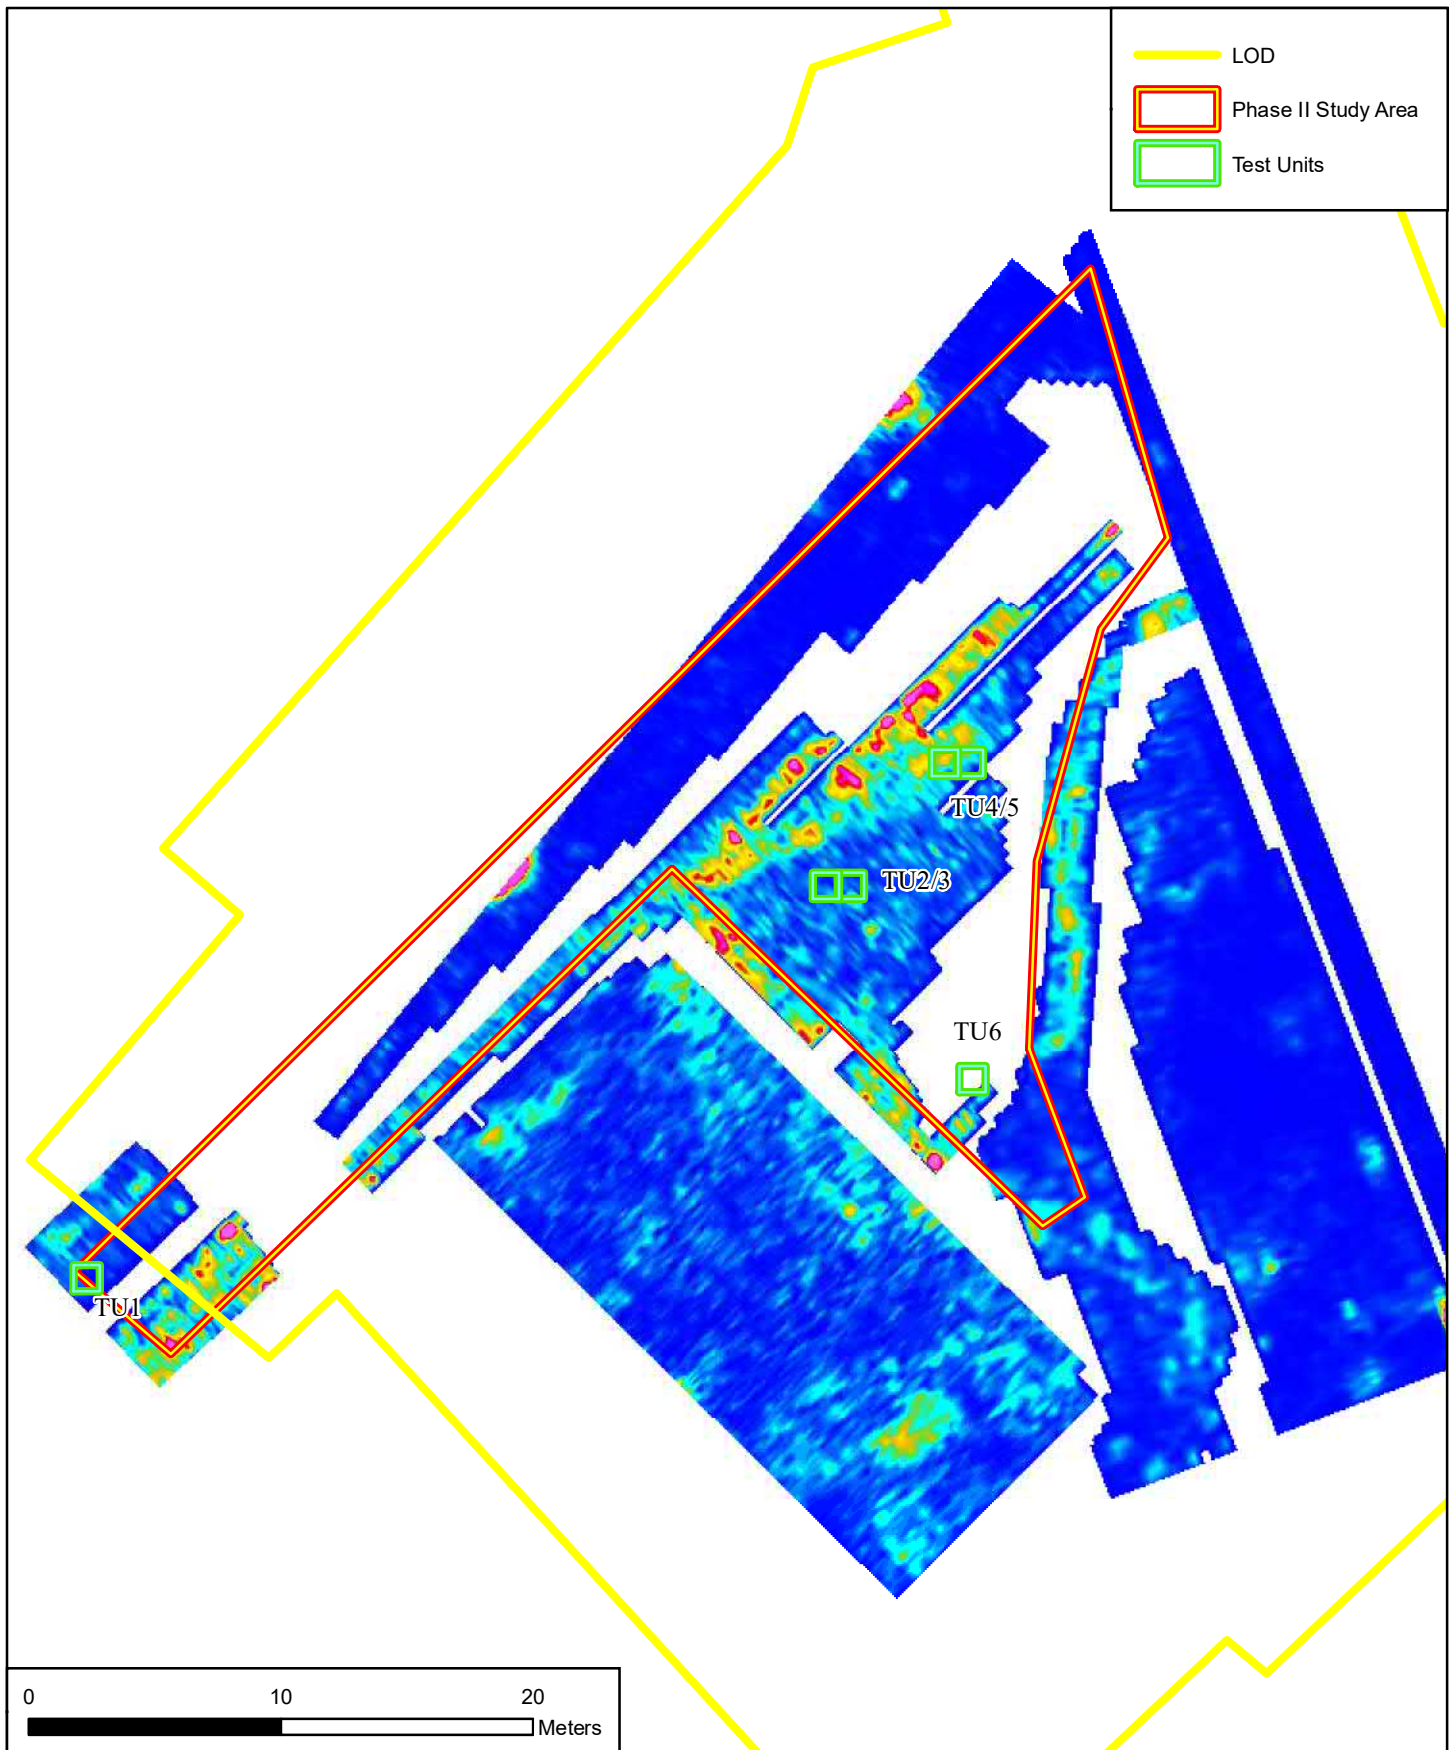

6.5 SITE INTERPRETATION

The oldest portions of the site exist in the area northwest of the current basketball court and may be present beneath the garbage enclosure structure north of the court. Feature 1, exposed between 100 and 120 cm bgs indicates there are the remains of a structure in this location. Geophysical survey recorded anomalies between 120 and 150 cm bgs north of the unit, which may be portions of the same structure or related structures (Figure 6-9). The anomaly to the south is likely related to sheds and garages seen on turn of the century maps. Diagnostic artifacts date the structure to the late eighteenth or early nineteenth centuries. The function of the building is difficult to ascertain. Logan's Wharf and Puke Works were present somewhere in this location at this time, but the building remains of Feature 1 do not have the signature of a warehouse. The wide variety of service and storage wares, particularly redwares, the concentration of smoking pipes, and faunal remains appears more typical of a domestic or tavern context. A number of 1851-1900 artifacts found in the location, and the depositional sequence described in Subsection 6.4, may indicate the building was demolished in the second half of the nineteenth century. Furthermore, there are no buildings in this location on any late nineteenth or early twentieth century maps collected for this project.

The area east of the basketball court and around TU 2/3 and TU 6 was occupied after the 1830s when the marshlands were reclaimed. During the mid- to late nineteenth century, a structure with a wooden floor (Feature 2) was built in the TU 2/3 area. A second building with a brick foundation (Feature 4) may have been built around this time in the TU 6 area as well.

Feature 2 may be associated with a building first seen on the 1878 Hopkins map (Figure 6-10) and identified as No. 3. Compromise Street on the 1885 Sanborn Map (Figure 6-11). The No. 3 building on the 1885 map had a small addition on the back, which may correspond to Feature 2. Geophysical survey results indicate small, localized anomalies, 60 to 100 cm bgs, throughout the area, surrounded by larger, rectilinear disturbances possibly associated with larger structures (Figure 6-12).

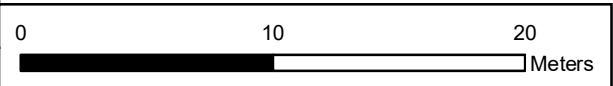

According to census and deed data, this building was built sometime around 1837. The building was owned by Daniel Hyde, who had a tannery on the property. Hyde's tannery occupied a large space and included a yard with vats, latches, limes, a handling house, beam house, finishing house, mill house, shop, foreman's house, workers' quarters, and the family residence. It is unclear which of these buildings was the residence, though the No.3 Compromise address seems likely, based on size and street frontage location. Around the 1880s, the Hyde's sold their property to the Floods, who operated a lumber yard on the east side of Compromise Street and may have lived either in the building at No. 3 Compromise Street or a brick building to the southwest, represented by Feature 4 in TU 6 (Figure 6-11).

The floor in Feature 2 includes cut nails holding the planks together, making it contemporaneous with the building on the early maps. The early artifact assemblage in TU 2/3, whatever its relation to Feature 2, appears primarily domestic, particularly considering the children's toys and slate pencils. The doll head in the assemblage and many of the ceramics date to the late nineteenth or early twentieth centuries and may reflect more occupation of the building after the Floods sold the property. By 1921, a cinderblock automotive garage and two attached wood sheds occupied the general area (Figure 6-13). As noted previously, the nature of the 1921 Sanborn map made it difficult to reference to either modern maps or previous Sanborn maps and thus the depiction of the LOD on this map is considered much more approximate than previous Sanborn maps.

Feature 4 corresponds to an unmarked building first illustrated on the 1878 Hopkins Atlas and the 1885 Sanborn map (Figures 6-10 and 6-11). Magnetic anomalies were recorded several meters west of TU 6 and may represent a more substantial portion of the building (Figures 6-9 and 6-12). The brick building was probably the home of the Floods, though the early maps do not clearly indicate its function. This building's location shifts slightly with each iteration of the Sanborn maps, and it is entirely absent from the 1903 map (Figure 6-14). However, a building with a similarly canted orientation reappears on the 1908 Atlas and is very likely the same structure. TU 6 always appears within or very near the footprint of the illustrated building on georeferenced maps. A linear magnetic anomaly recorded from 150 to 182 cm bgs, running perpendicular to Feature 4 and immediately south of TU 6, may be a deep foundation wall or utility associated with the building and indicates the significant depth to which the foundations extend (Figure 6-15).

7.0 SUMMARY AND RECOMMENDATIONS

The City of Annapolis contracted with AECOM to develop final engineering design plans and provide permitting support for the mitigation of flooding at City Dock through construction of a new pump station, realignment of existing storm drain systems, and grading along the existing bulkhead. The proposed undertaking will require ground-disturbing activities that could potentially impact subsurface archaeological resources. AECOM conducted a Phase II archaeological investigation within the proposed location of the control building and wet well to determine if deposits associated with previously recorded 18AP39 are present within the LOD, to evaluate the site's eligibility for listing in the NRHP, and to determine the location of significant archaeological deposits associated with the site within the LOD, if present.

As a result of the investigation, AECOM recovered 3,297 artifacts and identified intact archaeological features and occupational deposits ranging from the late eighteenth through the early twentieth centuries. Diagnostic artifacts dated from the early eighteenth to mid twentieth centuries were identified, in many instances, from secured contexts. Specifically, the excavation of six 1-x-1 m TUs resulted in the identification of a late eighteenth century foundation, a plank floor and post hole possibly constructed as early as the 1830s, but no later than the late nineteenth century, and a brick foundation related to a building constructed no later than 1878. The nineteenth century features can be linked to at least two artisan/merchant class families living and working at these locations between 1840 and the 1890s.

Historic research revealed the ownership of the property as well as the occupational history of those portions of the LOD investigated, linking ownership and occupation to such people as Charles Carroll, Barrister and William Logan in the eighteenth century; the Hyde family, who operated a tannery on the property in the late eighteenth and early nineteenth centuries; John B. Flood, who operated a lumberyard on the property in the late nineteenth century; and numerous families representing the diverse economy of Annapolis in the late nineteenth and early twentieth centuries, including Filipino immigrants affiliated with the U.S. Navy.

The site contains intact archaeological deposits and documentary evidence spanning a broad swath of the historical occupation of Annapolis. The site's depositional integrity (intact features, and generally sequential depositional layers) greatly elevate its research potential, as does the strong occupational context. Based on the results of this investigation and the 1984 investigation in the playground (Archaeology in Annapolis 1984), 18AP39 is recommended eligible for listing in the NRHP under both Criterion A and Criterion D. Under Criterion A, a site must demonstrate association with events that have made a significant contribution to broad patterns of history. Under Criterion D, a site must demonstrate the ability to yield information important to history or prehistory.

The site encapsulates the growth of the city of Annapolis as a commercial, industrial and residential center during the eighteenth, nineteenth, and early twentieth centuries. Data collected from the site can be useful in generating information on how the face of industry and commercial enterprises in Annapolis changed over time, how the city became a node in the early development of international trade routes, and the early development of the capitalist system, and how these changes impacted the socio-economic status of families involved in these enterprises.

Also, as noted in the geophysical survey report, the site also has the potential to contain deeply buried maritime related archaeological deposits including the eighteenth century wharf, other eighteenth and early nineteenth century shoreline improvements, and possibly scuttled ships to

stabilize the fill placed in this area in the 1830s. These resources, if present, would be deeply buried and difficult to reach using traditional archaeological methods.

The data collected during the Phase II testing, combined with results from the Phase Ia and geophysical studies, indicate that additional significant data can be obtained from 18AP30. Foundations of the late nineteenth century building, possibly owned by the Flood family, should be expected beneath approximately 50 cm of twentieth century fill (Strata I-IV in TU 6) in the locations immediately north and west of the brick paved plaza at the northeast corner of Compromise Street and Newman Street.

Further north, well preserved architectural remains associated with early twentieth and late nineteenth century buildings, some associated with the Hyde tannery and residence, may be encountered beneath thick deposits of twentieth century debris. Features 2 and 3, encountered in TU 2/3 were encountered beneath 85 cm of fill, including dense layers of rubble; these fill layers are represented by Strata I-VII. A second small building is clearly visible as a magnetic anomaly at approximately 60 cm bgs, several meters further northwest, near the northeast corner of the basketball court (Figure 6-12). Excavations in TU 4/5 suggest that some of the large magnetic anomalies in the northeast portion of the garden area are likely due to subsurface disturbance, likely related to utilities, but this doesn't preclude more deeply buried archaeological deposits in this location.

Conditions encountered in the western portion of the Phase II study area, within TU 1, indicate twentieth century deposits, some possibly associated with an auto garage illustrated on the 1921 Sanborn map (Figure 6-13) in the top 25 cm bgs (Strata I-III), followed by nineteenth to potentially late eighteenth century fill layers (Strata IV-VII) down to approximately 100 cm bgs. Beneath that, eighteenth century features should be anticipated, as evidenced by Feature 1. These depths are relative to the higher terraces on which the playground and garbage enclosure structure are built. Any excavations done in the lower landform south of the stone bulkhead wall that runs between the basketball court and the school parking lot, and east of the bulkhead wall separating the court from the playground, might encounter eighteenth century deposits at correspondingly shallower depths (approximately 60-80 cm bgs).

Archaeological deposits should also be expected beneath the basketball court. Geophysical anomalies were recorded throughout the court and were strongest near its northern entrance (Figure 6-9), where their depth indicates possible association with eighteenth century features, and in the southern parts of the court. The deposits in the southern part of the court may be associated with properties occupied by Filipino sailors and their families during the early twentieth century. As the Filipino diaspora in Maryland is not well studied, the potential significance of archaeological remains recovered from these locations may be high.

As it is unlikely that the significant archaeological deposits associated with 18AP39 can be avoided by the proposed project, it is recommended that it be agreed that the proposed project will have an Adverse Effect on these resources. It is recommended that discussions begin between the City, MHT, and the Federal Emergency Management Agency (FEMA), which will likely be the lead federal agency due to a forthcoming grant, as well as any other consulting parties with a vested interest in the project, regarding the preparation of a Memorandum of Agreement to address how to minimize and mitigate the adverse effects and outline the general methods to be used in documenting and reporting on archaeological resources prior to and during construction.

While the specific data recovery methods would depend, in part, on the final extent of the construction LOD, there are certain broad methods that should be incorporated into a data recovery plan. It is recommended that archaeological data recovery consist of the bulk removal of fill strata that do not contribute to the NRHP significance of the site coupled with the broad exposure of foundations and other cultural features. Features should be individually recorded and excavated along with the excavation of controlled TUs placed within foundations and in “yard” areas. If the final LOD includes impacts in areas currently covered by impervious surfaces, specifically the basketball court, it will need to be determined if data recovery excavations in these areas occur concurrently or are conducted within an archaeological monitoring program.

Due to the potential depth at which maritime-related features could be expected, it is unlikely that such features could be documented as part of traditional archaeological excavation. Rather, an archaeological monitoring program should be implemented for construction that would take into account the potential for encountering such features and how archaeological data recordation would occur.

Specific to the results of the Phase II evaluation, the following recommendations are made regarding which fill strata could be removed in bulk.

In the vicinity of TU 1, removal of Strata I-III can likely be done mechanically with no archaeological controls as these strata appear related to the early twentieth century auto garage and its later demolition. Lower strata, however, should be removed with archaeological controls, as they represent nineteenth and eighteenth century occupations and cap an apparently late eighteenth century feature documented within Stratum VII.

In the vicinity of TU 2/3, removal of Strata I-VI can likely be done mechanically with no archaeological controls as these strata appear related to mid- to late twentieth century demolition and fill episodes. Stratum VII and lower levels, however, should be removed with archaeological controls, as Stratum VII forms a shallow cap over intact nineteenth century archaeological features.

While TU 4/5 did not encounter intact archaeological deposits as it was abandoned during excavation at a depth of 75 cm bgs due to water intrusion, there remains a high potential for more deeply buried archaeological deposits. In this area, removal of Strata I-III can be done mechanically with no archaeological controls as these strata represent modern fill deposits. Below these strata, excavation should proceed with archaeological controls coupled with some form of dewatering.

In the vicinity of TU 6, removal of Strata I-III can likely be done mechanically with no archaeological controls as these strata represent modern fill. Excavation of Stratum IV may require archaeological control as it caps Feature 4, a foundation wall, and may retain information regarding the date of demolition.

Given the lack of geophysical returns within the brick-paved areas east of the Phase II archaeological evaluation, it is not expected that any terrestrial archaeological features or deposits are present within this area. Rather, this area, as with the entire northeastern half of the site, has the potential to contain maritime-related features and should be subjected to archaeological monitoring during construction.

Appendix A:
Qualifications of the Investigators

This Page Intentionally Blank

Scott Seibel, MSc, is a Registered Professional Archaeologist with over 22 years of experience in archaeological excavations, research, and compliance studies who exceeds the *Secretary of the Interior's Professional Qualification Standards* (36 CFR Part 61). Mr. Seibel has extensive cultural resource management experience, having served as Principal Investigator or Field Director for tens of thousands of acres of Phase I archaeological survey, dozens of Phase II evaluations, and 12 Phase III data recovery excavations across the United States. He received his BA in Archaeological Studies at the University of Texas at Austin in 1996 and his MSc in Archaeomaterials at the University of Sheffield in England in 1997.

Ralph Koziarski, PhD, has over 16 years of experience in cultural resources management and archaeological research and meets the *Secretary of the Interior's Professional Qualification Standards* (36 CFR Part 61) for archaeology and history. His career experience includes project management, field direction, crew supervision, analysis and report writing of archaeological survey, site testing and data recovery projects throughout much of the United States. He has worked on both historic and prehistoric sites for private, municipal, state, federal, and tribal clients. In addition, he has extensive experience in faunal analysis, public outreach and education. Dr. Koziarski holds an MS and PhD in Anthropology with a focus on Zooarchaeology from the University of Wisconsin-Milwaukee.

Peter Regan, MA, is a Registered Professional Archaeologist (RPA) with over 11 years of experience in cultural resources management and exceeds the Secretary of the Interior's professional qualifications for archaeology and history. He specializes in historic site analyses, biological archaeology, historic research, and developing public outreach platforms for archaeological sites and other places of cultural interest. Mr. Regan has worked throughout the United States for numerous federal, state, municipal, and private clients on a wide variety of sites under all phases of excavation. In addition to extensive compliance-driven experience, Mr. Regan has served as a research consultant for archaeology and cultural outreach projects and is Vice Chairman of Frederick, Maryland's Historic Preservation Commission. As a Senior Archaeologist and Senior Historian with AECOM, he directs field projects, generates high quality technical documents, and contributes to numerous aspects of project execution, data analysis, and interagency coordination.

100 Community Place
Crownsville, Maryland 21032

Site Number: 18__ AP39

County: Anne Arundel

A. DESIGNATION

1. Site Name: Newman Street
2. Alternate Site Name/Numbers: _____
3. Site Type (describe site chronology and function; see instructions):
18th-20th Century fill deposits, possible wharf, tannery, lumber yard and domestic

4. Prehistoric _____ Historic x _____ Unknown _____
5. Terrestrial x _____ Submerged/Underwater _____ Both _____

B. LOCATION

6. USGS 7.5' Quadrangle(s): Annapolis | (For underwater sites)
| NOAA Chart No.: _____
| _____
(Photocopy section of quad or chart on page 4 and mark site location)

Latitude in decimal degrees _____ Longitude in decimal degrees _____

7. Maryland Archeological Research Unit Number: 7
8. Physiographic Province (check one):
_____ Allegany Plateau _____ Lancaster/Frederick Lowland
_____ Ridge and Valley _____ Eastern Piedmont
_____ Great Valley _____ x Western Shore Coastal Plain
_____ Blue Ridge _____ Eastern Shore Coastal Plain
9. Major Watershed/Underwater Zone (see instructions for map and list): West Chesapeake

C. ENVIRONMENTAL DATA

10. Nearest Water Source: Spa Creek Stream Order: _____
11. Closest Surface Water Type (check all applicable):
_____ Ocean _____ Freshwater Stream/River
x _____ Estuarine Bay/Tidal River _____ Freshwater Swamp
_____ Tidal or Marsh _____ Lake or Pond
_____ Spring
12. Distance from closest surface water: 70 meters (or _____ feet)

C. ENVIRONMENTAL DATA [CONTINUED]

13. Current water speed: na knots

14. Water Depth: na meters

15. Water visibility: na

16. SCS Soils Typology and/or Sediment Type: Collington, Wist

17. Topographic Settings (check all applicable):

☐ Floodplain

☐ Interior Flat

☐ Terrace

☒ Low Terrace

☐ High Terrace

☐ Hillslope

☐ Hilltop/Bluff

☐ Upland Flat

☐ Ridgetop

☐ Rockshelter/Cave

☐ Unknown

☒ Other:
made land

18. Slope: 0

19. Elevation: 2-4 meters (or feet) above sea level

20. Land use at site when last field checked (check all applicable):

☐ Plowed/Tilled

☐ No-Till

☒ Wooded/Forested

☐ Logging/Logged

☒ Underbrush/Overgrown

☐ Pasture

☐ Cemetery

☐ Commercial

☐ Educational

☐ Extractive

☐ Military

☒ Recreational

☐ Residential

☐ Ruin

☐ Standing Structure

☐ Transportation

☐ Unknown

☐ Other:

21. Condition of site:

☒ Disturbed

☐ Undisturbed

☐ Unknown

22. Cause of disturbance/destruction (check all applicable):

☐ Plowed

☐ Eroded/Eroding

☒ Graded/Contoured

☐ Collected

☐ Vandalized/Looted

☐ Dredged

☐ Heavy Marine Traffic

☒ Other:
Excavation and filling. Building construction

23. Extent of disturbance:

☒ Minor (0-10%)

☐ Moderate (10-60%)

☐ Major (60-99%)

☐ Total (100%)

☐ % unknown

C. ENVIRONMENTAL DATA [CONTINUED]

24. Describe site setting with respect to local natural and cultural landmarks (topography, hydrology, fences, structures, roads). Use continuation sheet if needed.

Site is in a public park west of Compromise Street and northwest of Newman Street. Site is at the foot of the slope to cove on Spa Creek that later became the City Dock. Excavations in the eastern portions of the site revealed at least 4 feet of late 19th and 20th century fill. Up to 4 ft of fill of 19th and 20th century fill were recorded in the playground area, with 18th century landscapes beneath. The western portion of the site was on waterfront until ca 1819-1840, when fill was deposited to build Compromise Street and enclose the harbor to the east.

25. Characterize site stratigraphy. Include a representative profile on separate sheet, if applicable. Address plowzone (presence/absence), subplowzone features and levels, if any, and how stratigraphy affects site integrity. Use continuation sheet if needed.

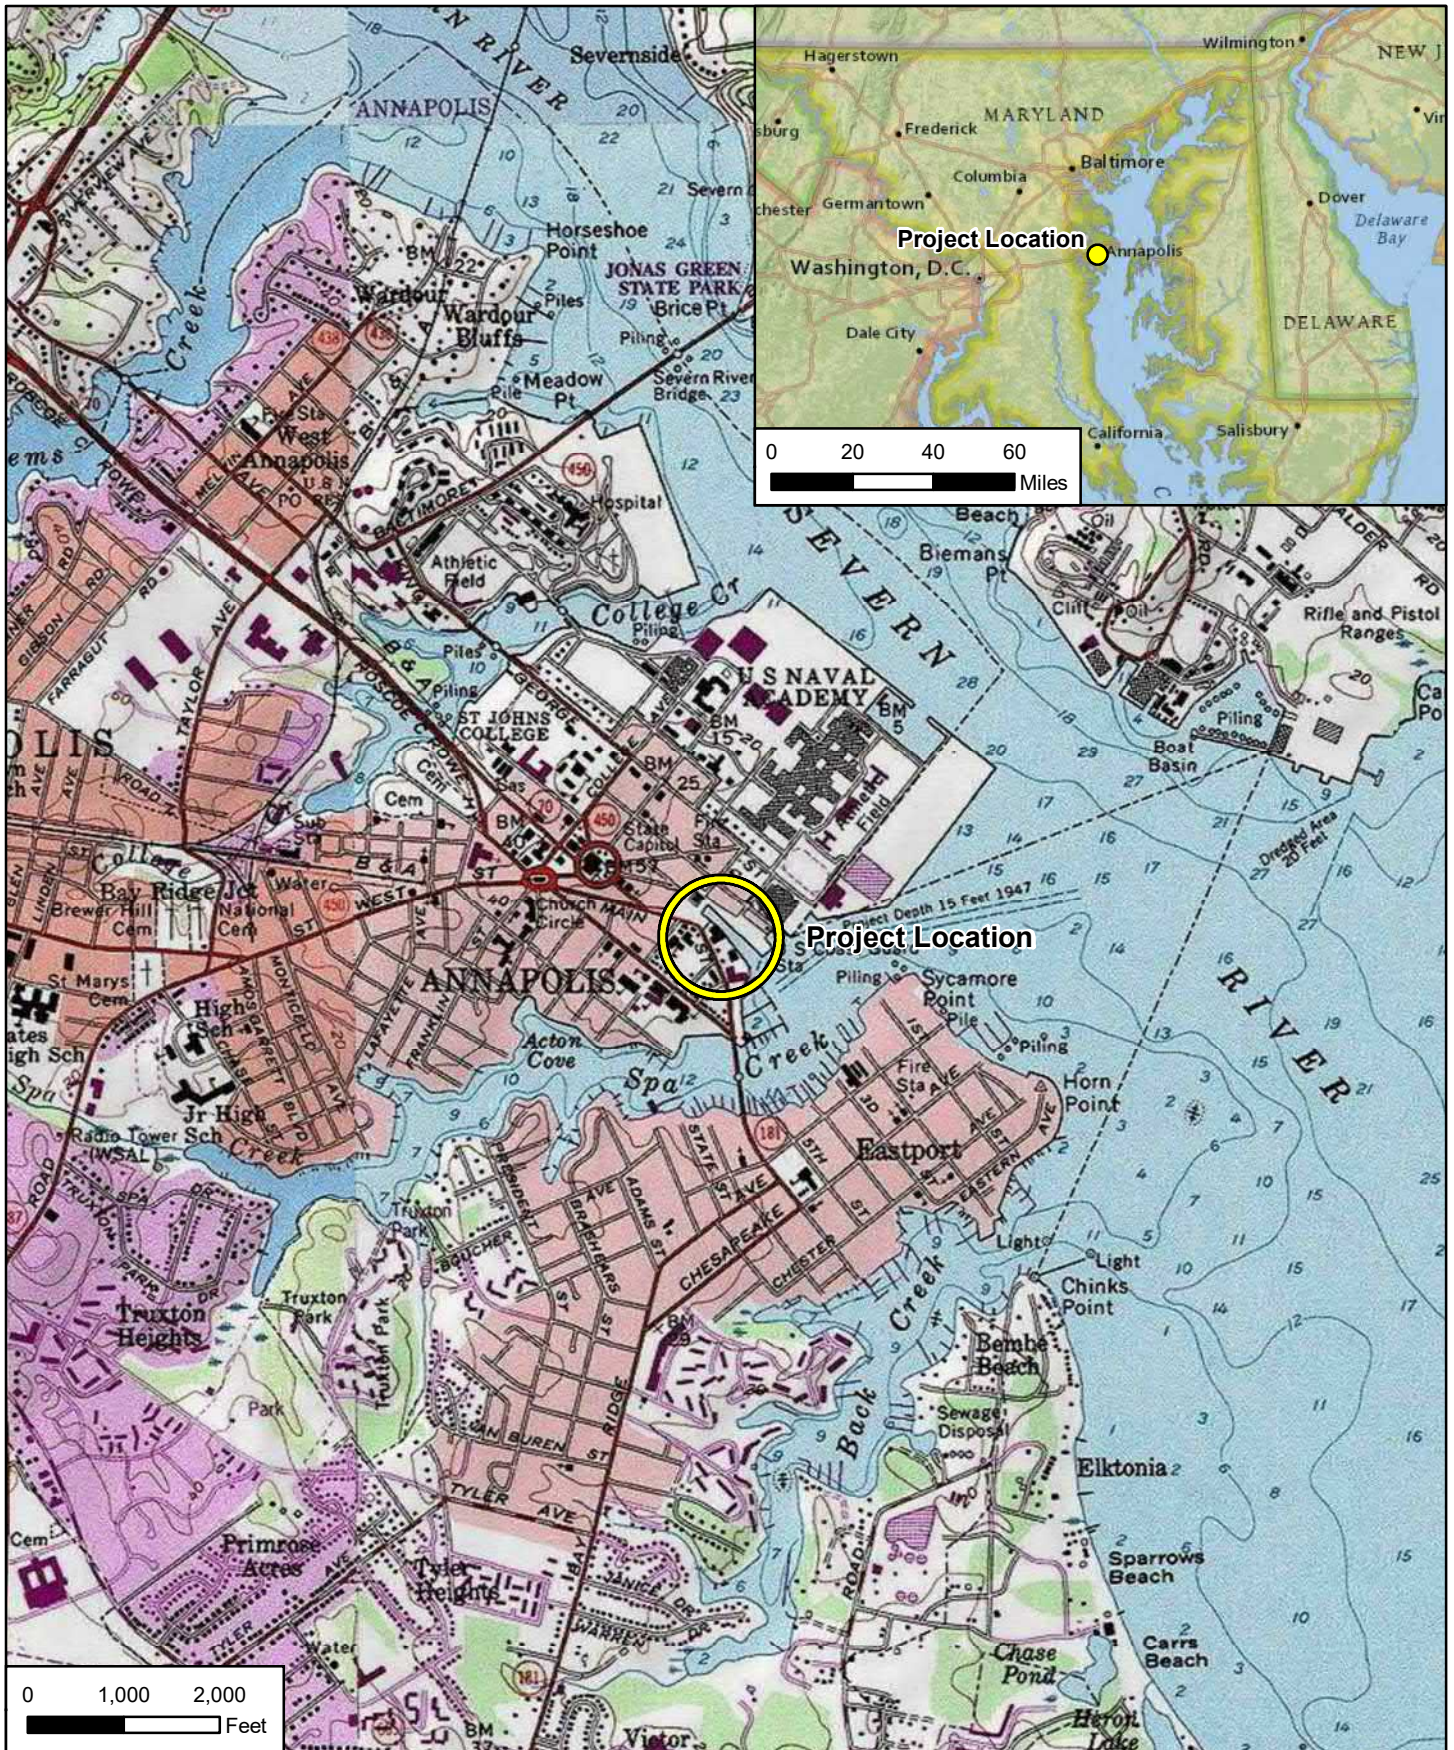

Soils within the geophysical survey area are mapped as Urban Land and Collington-Wist-Urban Land (CpB) complex by the United States Department of Agriculture's Natural Resources Conservation Service. Site stratigraphy consists of extensive filling that extends into late 18th/early 19th century. Intact historic architectural features, intact living surfaces are among the fill layers.

26. Site size: 70 meters by 48 meters (or _____ feet by _____ feet)

27. Draw a sketch map of the site and immediate environs, here or on separate sheet:

46. Site Summary/Additional Comments (append additional pages if needed):

The site represents 300 years of residential, commercial, and light industrial use of the Annapolis waterfront. The oldest portions of the site exist in the area northwest of the current basketball court Feature 1, a stone wall, exposed between 100 and 120 cm bgs indicates there are the remains of a structure in this location. Diagnostic artifacts date the structure to the late eighteenth or early nineteenth centuries. The function of the building is difficult to ascertain. Logan's Wharf and Peruke Works were present somewhere in this location at this time, but the building remains of Feature 1 do not have the signature of a warehouse. The wide variety of service and storage wares, particularly redwares, the concentration of smoking pipes, and faunal remains appears more typical of a domestic or tavern context. A number of 1851-1900 artifacts found in the location indicate the building was demolished in the second half of the nineteenth century. Furthermore, there are no buildings in this location on any late nineteenth or early twentieth century maps collected for this project.

The area east of the basketball court was occupied after the 1830s when the marshlands were reclaimed. During the mid to late nineteenth century, a structure with a wooden floor (Feature 2) and a second building with a brick foundation (Feature 4) were built in the area east of the court and in the current rain garden area. The floor identified as Feature 2 in TU 2/3 may be associated with building first seen on the 1878 Hopkins map and identified as No 3. Compromise Street on the 1885 Sanborn Map. The No .3 building on the 1885 map has a small addition on the back, which may correspond to Feature 2. Feature and map don't line up precisely, but small structures on hand drawn historic maps do not always scale properly and are difficult to georeference with precision. Geophysical survey results indicate small, localized anomalies, 60 to 100 cm bgs throughout the area, and surrounded by larger, rectilinear disturbances associated with larger structures.

According to census and deed data, the No.3 Compromise building may have been built sometime around 1837. The building was owned by Daniel Hyde, who had a tannery on the property. Hyde's tannery occupied a large space and included a yard with vats, limes, a handling house, beam house, finishing house, mill house, shop, foreman's house, workers' quarters, and the family residence. It is unclear which of these buildings was the residence, though the No.3 Compromise address seems likely, based on size and street frontage location. Around the 1880s, the Hyde's sold their property to the Floods, who operated a lumber yard on the east side of Compromise Street and may have lived either in the building at No. 3 Compromise Street or a brick building illustrated to the southwest, represented by Feature 4 in TU 6.

The floor in Feature 2 includes cut nails holding the planks together, making it contemporaneous with the building on the early maps. The early artifact assemblage in TU 2/3, whatever its relation to Feature 2, appears primarily domestic, particularly considering the children's toys and slate pencils. The doll head in the assemblage and many of the ceramics date to the late nineteenth or early twentieth centuries and may reflect more occupation of the building after the Floods sold the property. By 1921, a cinderblock automotive garage and two attached wood sheds occupied the area.

Feature 4 appears to correspond to an unmarked building first illustrated on the 1878 Hopkins map and the 1885 Sanborn maps (Figures 6-10 and 6-11). Magnetic anomalies were recorded several meters west of TU 6, and likely correspond to a more substantial portion of the building. The brick building was probably residential and possibly the home of the Floods, though the early maps do not clearly indicate its function. This building's location shifts slightly with each iteration of the Sanborn Atlas.

MARYLAND ARCHEOLOGICAL SITE SURVEY: PREHISTORIC DATA FORM

Site Number 18_____

1. Site type (check all applicable):
